Liberty Imaging, LLC

Michael Lewis  
Founder  
Wireless Harlem

Dharma Dailey  
Director of Research  
Ethos Group

CHAIRPERSON BREWER: Good morning.

We're actually starting on time. My name is Gale Brewer and I chair the City Council Committee on Technology in Government. And we're here today to talk about a particular resolution, which we will go through in the PowerPoint presentation. I want to thank everyone for joining us here today. This is a Committee that has existed for the last seven years. We have a commitment to making sure that there is as much access as possible to whatever broadband exists. We've worked in schools and senior centers and we fought about spectrum. I think there's almost no topic we haven't discussed. So I really appreciate everyone being here today and your tremendous interest, so why don't we get started and then we'll hear from those who are going to testify? So this is an intro, a resolution, number 1613 that talks about the regulation and use of the unallocated portion of the radio spectrum also known as white spaces. I think if you're not as involved as people here today you wouldn't know what in the world we're talking about. But it has to do with the fact that when we go from rabbit ears, as some of us

1  
2 call it, to using more sophisticated digital on  
3 some of our television sets, there will be these  
4 white spaces, which are unutilized radio wave  
5 frequencies of the electromagnetic spectrum  
6 between licensed TV channels that are used to keep  
7 one channel from bleeding into its neighbor. The  
8 Federal Communications Commission, also known as  
9 the FCC, has permitted the licensed use of white  
10 spaces for low power short-range broadcasts to  
11 groups, including broadcast networks and motion  
12 picture and television program producers. White  
13 spaces are currently utilized by numerous  
14 consumers, including sporting events, film and  
15 television productions, music productions, live  
16 theatre, certainly something that's very much a  
17 part of New York City, and houses of worship  
18 through the use of wireless microphones. The FCC  
19 issued a notice of proposed rule making, MPRM in  
20 May 2004 to allow wireless devices to use white  
21 spaces on an unlicensed basis. In October 2006,  
22 the FCC adopted a first report in order and  
23 further MPRM approving the use of fixed low power  
24 devices to operate on any channel that is not  
25 already being used by other authorized services.

1  
2 The FCC also ruled that they will further study  
3 whether or not permitting low power personal  
4 portable devices, again something that people  
5 can't really even conceive of right now, to  
6 operate in the open spectrum will cause  
7 interference to other users. But again, this is  
8 all coming in the future and exciting. In  
9 response to the 2006 ruling, the FCC laboratory  
10 conducted a study to measure whether white space  
11 devices known as WSDs used spectrum sensing  
12 technology to detect the signals of other stations  
13 and its ability to interfere with TV reception,  
14 something that's on everyone's mind, and wireless  
15 microphone operations. Then in January 31st, 2007  
16 the FCC's office of engineering and technology  
17 released a report that concluded that such devices  
18 could not reliably detect the presence of  
19 incumbent transmissions and is capable of causing  
20 interference to TV broadcasting and wireless  
21 microphones. The wireless microphones are used on  
22 Broadway. In January 2008, the FCC announced that  
23 it would begin a second phase of performance  
24 testing on these WSDs, which includes laboratory  
25 and field tests, tests is spelled wrong, that are

1 conducted openly for the public to view. Two  
2 field tests were conducted in August 2008, one at  
3 the FedEx Field in Landover, Maryland and at the  
4 Majestic Theatre in New York City. The FCC has  
5 not released these findings. Proponents of  
6 allowing portable wireless devices to access the  
7 Internet using unlicensed white spaces believe  
8 that the use of the unused spectrum will provide  
9 consumers with inexpensive high-speed Internet  
10 access, since signals can travel long distances  
11 and penetrate buildings. Proponents state that  
12 the availability of white spaces for portable  
13 devices will enhance local coverage and  
14 communications, spur new communication  
15 technologies and improve public safety and e-  
16 government services, something we've obviously  
17 talked about at this Committee. Proponents also  
18 believe that the WSDs, the devices that include  
19 interference reducing features are capable of  
20 detecting occupied frequency and avoiding  
21 interference to other channels. Opponents believe  
22 that the proposed wireless devices may impact  
23 wireless microphones and other technologies that  
24 have historically relied on these frequencies.  
25

1  
2 Wireless microphone operators and broadcast  
3 companies are worried that a proliferation of  
4 these devices operated by regular folks without  
5 any ability to coordinate their use will interfere  
6 with wireless microphones in local areas and clear  
7 television viewing. Many organizations feel that  
8 the FCC should not allow portable devices to use  
9 this area of the spectrum until the devices are  
10 proven to always detect other signals and avoid  
11 those frequencies. So you can see that there is a  
12 lot of discussion. I think that the bottom line  
13 is that we all want everything. And hopefully  
14 with some discussion here and in Washington, we  
15 will be successful. So I'd like to first call the  
16 first panel, which is Laurie Baskin, from the  
17 Performing Arts Alliance and Theatre Communities;  
18 Charlotte St. Martin from Broadway League,  
19 Martino; Ira Mont, who is from Actors' Equity.  
20 You should all come up to the table here. And  
21 Mary Landolfi, who is from local 802, which is the  
22 Musicians' Union. I'd like to thank Jeffrey  
23 Baker, who is Counsel to the Committee, on my  
24 left; and Colleen Pagter, who is the Policy  
25 Analyst, and Samuel Wong from my office. Also, I

1  
2 think Lionel Francis is also here from the finance  
3 division. Welcome. We called four people.  
4 There's only three of you. Is that-- well, why  
5 don't we start with the three of you? Whoever  
6 would like to begin introduce yourself and please  
7 give your remarks.

8 MARY LANDOLFI: Thank you. Good  
9 morning. Before I begin I would like to thank the  
10 Chair, Councilwoman Brewer, and all the members of  
11 the Committee on Technology in Government for the  
12 opportunity to present testimony at this hearing.  
13 My name is Mary Landolfi, and I am the president  
14 of the American Federation of Musician's Local  
15 802. I am here to address the serious issue of  
16 the FCC's testing of mobile Internet devices  
17 designed to operate in what is known as white  
18 spaces, the frequencies between television  
19 channels. We at local 802, and our parent  
20 organization, The American Federation of  
21 Musicians, believe this to be a very risky  
22 proposal that will have devastating effects on  
23 live concerts, Broadway productions, symphonic  
24 performances and any event where wireless  
25 microphones are used. These Internet devices will

1  
2 operate on frequencies close to or even on top of  
3 those used by wireless microphones. This will  
4 create a very high chance of interference, thereby  
5 ruining the audience's experience. The economic  
6 effect of any reduction in audience enjoyment of  
7 live performance is potentially devastating.

8 Broadway alone contributed over 5 billion dollars  
9 to New York City's economy during the 2006-2007

10 season. The sound engineers on each production  
11 work with broadcasters and others who use the  
12 white spaces for wireless microphones to ensure  
13 that all users operate on separate frequencies.

14 The success of these vital steps requires, among  
15 other things, sufficient space between the  
16 frequencies in order to guarantee no interference.

17 Permitting the use of white space devices before  
18 it is irrefutably proven that they can reliably  
19 detect when frequencies are occupied and that they  
20 will not interfere with incumbent wireless

21 microphones puts Broadway's economic contribution

22 to the New York economy at risk. Thus far, the

23 Internet white space devices tested by the FCC

24 have failed to reliably detect when white space

25 frequencies are in use. Without reliable

1  
2 detection these new devices will interfere with  
3 other incumbent microphones or broadcasters.  
4 Allowing untested mobile internet devices to  
5 operate on television white space frequencies,  
6 which will be used by non-professionals i.e.  
7 consumers who cannot be expected to coordinate  
8 frequencies with other users, will almost  
9 guarantee interference with other incumbent  
10 wireless microphone users and broadcasters. In  
11 some markets the white spaces often do not even  
12 exist. In New York City, Los Angeles, Los Vegas,  
13 Nashville and other cities with large  
14 entertainment and cultural markets, the so-called  
15 white spaces are being used by wireless  
16 microphones. In other words, there is no space  
17 for these new devices to operate. Beaconsing  
18 technology, which white space device proponents  
19 claim is a suitable solution to the interference  
20 problem has yet to be tested and has never been  
21 made public by the manufacturers. We have no idea  
22 if this technology is possible or if it will work  
23 correctly. Furthermore, a great deal of  
24 professional concert halls and theatres are non-  
25 profit organizations that may not be able to

1  
2 afford the beaconing technology, even if it does  
3 help with the interference problem. It should not  
4 be incumbent upon them to purchase this new  
5 technology when the FCC for the last 35 years has  
6 allowed professional theatres to operate on the  
7 television white spaces without a problem. For  
8 the record, the American Federation of Musicians  
9 is not opposed to new mobile Internet devices  
10 operating in the white spaces. We understand the  
11 benefit they might offer to the public. However,  
12 just as a responsible automobile manufacturer  
13 doesn't release a new car into the market until it  
14 has been rigorously tested in both lab and real  
15 world settings, we call on the FCC to prohibit the  
16 production, sale or use of these devices until it  
17 has done the same. The FCC must establish beyond  
18 all doubt in the lab and in the real world that  
19 these products will in no way jeopardize New  
20 York's audience experiences or pose any risk to  
21 our economy by interfering with incumbent wireless  
22 microphone use. Thank you.

23 CHAIRPERSON BREWER: Thank you very  
24 much. Go ahead, sir.

25 IRA MONT: Good morning Chairwoman

1  
2 Brewer and members of the Technology in Government  
3 Committee. Thank you for holding this hearing on  
4 the regulation and use of unallocated portion of  
5 the radio spectrum known as white spaces. My name  
6 is Ira Mont and I am the Third Vice President of  
7 Actors' Equity Association, which represents more  
8 than 47,000 professional stage actors and stage  
9 managers nationwide. I am currently the  
10 production stage manager of my sixth Broadway  
11 musical, the new Mel Brooks musical, Young  
12 Frankenstein, which gives me firsthand experience  
13 on the use of the wireless microphones, headset  
14 communications and scenic elements that operate on  
15 these white spaces. For the last several decades,  
16 the theatrical community has relied on the use of  
17 wireless headsets allowing communications  
18 backstage that are indispensable to the integrity  
19 of the show, but more importantly to the safety of  
20 the actors and dozens of industry professionals  
21 who work backstage. In addition, wireless  
22 microphones are used by the actors so that the  
23 sound heard by the audience is clear, distinct and  
24 well balanced. Because of the limited space and  
25 the highly technical aspect of each production,

1  
2 the choreography backstage is often more intricate  
3 than what is on stage. During each performance of  
4 Young Frankenstein I, and my stage management  
5 team, call several hundred cues. These cues are  
6 for lighting, elevators, scenery that can often  
7 weigh several tons that flies in or moves on or  
8 off stage, trapdoors opening and closing, smoke,  
9 fog and pyrotechnics, just to name a few. These  
10 cues also alert the actors to their entrances,  
11 whether it is to walk on to stage or fly in on  
12 apparatus from above the stage. The wireless  
13 microphone and communication systems are a highly  
14 complex process and they require frequent  
15 recalibration to the show's system before each  
16 performance in order to avoid interference with  
17 the many other uses of the white space spectrum,  
18 including our neighboring shows. Without these  
19 systems, theatrical venues from the 30 some odd  
20 Broadway theatres and dozens of others here in New  
21 York to the over 1,000 theatres across the  
22 country, small developing theatres, large regional  
23 theatres and arenas, they simply will not be able  
24 to operate and the results will likely be damaging  
25 for both the venues and the communities in which

1  
2 they are located. These theatres, like Broadway,  
3 are often important economic engines for these  
4 cities and towns, and just like Broadway; these  
5 theatres help to support dozens of ancillary  
6 business, returning hard-earned dollars into the  
7 communities. Technological advances have allowed  
8 theatrical productions to become more inventive,  
9 incorporating elements of spectacle and wonder  
10 into the performances. However, these lavish  
11 Broadway musicals, which audiences across the  
12 nation have come to expect and enjoy, could be  
13 changed forever if the FCC allows white spaces to  
14 be used for devices that deliver high speed  
15 broadband internet to personal portable devices.  
16 The FCC testing has consistently shown these  
17 devices do not accurately detect occupied channels  
18 and could interfere with the wireless systems used  
19 in theatrical ventures. Actors Equity Association  
20 applauds the New York City Council's Committee on  
21 Technology in Government for its proposed  
22 resolution in which the Council urges the FCC to  
23 refrain from implementing the proposed regulatory  
24 amendments without ensuring such amendments will  
25 not have a negative impact on all incumbent

2 wireless users. Without safeguards that prove  
3 that the portable devices will not interfere with  
4 the white space usage and strongly worded  
5 protective amendments, the proposed regulatory  
6 amendments could devastate live theatre, as we  
7 know it. Thank you very much.

8 CHAIRPERSON BREWER: Thank you very  
9 much. Go ahead.

10 LAURIE BASKIN: Good morning. Dear  
11 Council Member Brewer and members of the City  
12 Council, thank you for holding this hearing on the  
13 white spaces, for providing leadership and trying  
14 to protect the performing arts here in New York  
15 City and for allowing me to appear before you to  
16 provide public testimony. I am Laurie Baskin,  
17 Director of Government and Educational Programs at  
18 Theatre Communications Group. TCG is a founding  
19 member of the Performing Arts Alliance, formerly  
20 called the American Arts Alliance. The Performing  
21 Arts Alliance members include the Association of  
22 Performing Arts Presenters, Dance USA, The League  
23 of American Orchestras, Opera America, Theatre  
24 Communications Group, Chorus America and the  
25 National Alliance for Musical Theatres. I am here

1  
2 to testify on behalf of the entire Performing Arts  
3 Alliance and all of our members. I am here to  
4 stress the importance of maintaining interference  
5 free and affordable use of wireless microphone and  
6 related audio equipment currently being used by  
7 communities, performers and audiences. The  
8 Performing Arts Alliance is a national network of  
9 more than 4,000 members, comprising the  
10 professional non-profit performing arts and  
11 presenting fields. For 30 years the Performing  
12 Arts Alliance has been the premiere advocate for  
13 America's professional non-profit arts  
14 organizations, artists and their publics before  
15 the US Congress and key policymakers. Through  
16 legislative and grassroots action, the performing  
17 arts alliance advocates for national policies that  
18 recognize enhance and foster the contributions  
19 made by the performing arts to America.

20 Professional wireless sound equipment is used to  
21 provide high quality audio to our audiences and to  
22 record and present these artistic performances to  
23 people all over the world through broadcast on  
24 cable, television, satellite and the Internet.

25 Wireless microphones and related wireless audio

1  
2 equipment are used extensively and play a critical  
3 role in the production of dance, music, opera,  
4 orchestra and theatre performances. Audiences  
5 would not hear the performers without wireless  
6 microphones and the recording of such productions  
7 provide an infinite opportunity to expand the  
8 audience and availability of these performances to  
9 individuals who are unable to attend live  
10 performances. Many performances require as many  
11 as 45 frequencies for each production. Wireless  
12 microphones and equipment are utilized to  
13 facilitate communication between backstage staff  
14 members and performers. Directors, managers,  
15 crewmembers and many others rely upon such  
16 equipment to communicate performance and lighting  
17 cues, staging movement and other vital directions.  
18 The use of wired audio equipment would not only be  
19 impractical, but would create an unsafe and  
20 dangerous work area for performers and staff.  
21 Wireless microphones and audio equipment provide  
22 the freedom to move safely and quickly through the  
23 stage environment while providing high quality and  
24 reliable audio transmissions. There is no  
25 practical or feasible alternative to the wireless

1  
2 audio systems currently used by performing arts  
3 organizations. Without them the performing arts  
4 would be silent. We applaud the City Council's  
5 resolution urging the FCC to refrain from  
6 implementing proposed regulatory amendments that  
7 would allow portable devices to operate on the  
8 white space radio spectrum without ensuring that  
9 such amendments would not negatively impact the  
10 performing arts and all incumbent wireless  
11 microphone users. We have asked the Commission to  
12 craft rules, which would require that new portable  
13 devices intended to operate in this spectrum not  
14 be permitted until they are tested and verified  
15 that they will not disrupt wireless equipment. We  
16 have further requested that the Commission  
17 designate certain clean spectrum that can be used  
18 by our audio systems without the threat of  
19 interference from the new devices and to adopt  
20 appropriate protections. Without the high quality  
21 and interference free operation of wireless  
22 microphones, the audio quality of performing arts  
23 performances and recordings would be greatly  
24 diminished, impairing thousands of productions and  
25 reducing the availability and opportunity for

1 millions of Americans to enjoy these art forms.

2 The performing arts sector is hopeful that  
3 whatever the technical solution, that it prevents  
4 interference and also acknowledges the sector's  
5 legitimate and continuing use within the spectrum.

6 Performing arts organizations have used wireless  
7 technology in our performance spaces for at least  
8 30 years. We have never fit into any of the

9 license categories, and so we currently operate  
10 unlicensed. Yet the technology has long existed

11 that allows our members to present high quality  
12 performances that millions of audience members

13 across the country have come to expect and

14 certainly deserve. It seems that the FCC simply

15 hasn't caught up with the performing arts in terms  
16 of acknowledging optimal conditions for arts

17 organizations to serve the public. Over the past

18 year there have been two informal white space

19 demonstrations held in New York City and organized

20 by the Broadway League. Each demonstration was

21 attended by an FCC commissioner who witnessed the

22 kind of interference that could happen if new

23 devices and the policies regulating those devices

24 do not contain adequate safeguards. Further the  
25

1  
2 FCC held its final white space official field test  
3 at the Majestic Theatre, here in New York. We  
4 believe that because they have visited performing  
5 arts venues in New York and have held a final  
6 field test here that the FCC Commissioners  
7 recognize the importance of the performing arts to  
8 New York and the country, and they are interested  
9 in a solution that serves all parties. In  
10 addition, the non-profit performing arts sector  
11 cannot shoulder the financial burden of a  
12 transition alone. Our members operate under tight  
13 financial constraints and the purchase or upgrade  
14 of new equipment all at once would be impossible,  
15 even for our larger members. The Performing Arts  
16 Alliance respectfully asks the City Council to  
17 communicate to the FCC the importance of ensuring  
18 that any changes in the use of the broadcast  
19 spectrum will not disrupt dance, music, opera,  
20 orchestra and theatre performances enjoyed by  
21 millions of Americans. Absent tested and proven  
22 interference protection measures, especially the  
23 operation of personal portable devices within a  
24 performance space, could wreak havoc with the  
25 wireless microphone systems and audio equipment.

1  
2 Not only would this disrupt the audience's  
3 enjoyment of the performance and impair the  
4 recording and broadcast of the performance, but it  
5 would also hinder the ability of stage crews to  
6 communicate effectively and the artists to perform  
7 safely. The FCC should continue its careful  
8 testing and craft policies that will ensure that  
9 change in the use of the broadcast spectrum will  
10 not interfere with the wireless microphone and  
11 audio equipment that is essential to bringing live  
12 performances to millions. Thank you.

13 CHAIRPERSON BREWER: Thank you all  
14 very much. I think we all can say that we want to  
15 make sure that whatever is decided, we want to  
16 make sure that Broadway is first and foremost and  
17 any-- and the theatre in general, on anybody's  
18 list. So I appreciate your expertise that you  
19 have gained so quickly on this topic, and that you  
20 are here today to share it. We really appreciate  
21 that. I think that Heidi Mathis from the Shubert  
22 Organization wanted to also come up from the  
23 Broadway League. I know that you just got here.  
24 Why don't we ask questions and then you could  
25 bring your statement. Come on up. Yeah, come up

1  
2 and join us. Well let me ask you just a couple of  
3 questions while she's coming up. One of them is  
4 this issue of the microphones and you don't want  
5 to-- I want you to be wireless. How does the  
6 microphone purchase work now? Because I don't  
7 like the word when they say you're unlicensed. It  
8 sounds like it's illegal; because you've actually  
9 been doing this for 30 years and you have amazing  
10 expertise and you coordinate and you-- so I just,  
11 I have three questions as part of that; one is,  
12 would you like to be licensed as part of this  
13 discussion? Does the way in which this is working  
14 where hopefully there will be absolutely room for  
15 Broadway and any other production to succeed; and  
16 how do you think that might work out if the FCC is  
17 doing it correctly? What would you like to see in  
18 terms of the optimum with the FCC? Those are my  
19 two questions.

20 LAURIE BASKIN: Honestly, I don't  
21 even know the answer to that because I'm not sure  
22 what the cost implications would be. We would  
23 like to be legitimate and to have further  
24 conversation about the best way to achieve that.

25 CHAIRPERSON BREWER: Okay. Anybody

1  
2  
3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

else want to add to that conversation?

IRA MONT: I think that pretty much covers it. It's been so status quo for so many decades, the way the sound shops set up the systems, the cost would clearly be a factor that everyone would have to consider, but also the likely bureaucracy of changing the licensing, because of course frequencies are used by a show or an event of some kind and then that show is done and closes. And so then those frequencies are released by that show, they're not using it, and the next show coming in-- the constant turnaround by all of the different users would, even beyond cost, which is clearly preeminent in everybody's mind, just the ability to get the licensing that might be required in a timely fashion, it's pretty unlikely that it would happen the way that performing arts ventures have to happen.

CHAIRPERSON BREWER: And how did the Majestic Theatre demo go? Did it seem to go well? Was there information that was shared? Do you want to go ahead and start to testify?

HEIDI MATHIS: Yeah, sure.

2 CHAIRPERSON BREWER: Okay. Go  
3 ahead.

4 HEIDI MATHIS: Okay. I will go  
5 ahead and give the testimony--

6 CHAIRPERSON BREWER: [Interposing]  
7 Sure.

8 HEIDI MATHIS: And then answer your  
9 question. Good morning. I'm Heidi Mathis, the  
10 Corporate Relations Manager for the Shubert  
11 Organization here on behalf of the Broadway  
12 League, the national trade association of the  
13 commercial Broadway industry with over 600 members  
14 throughout North America. As you undoubtedly  
15 know, issues the FCC is deciding today will  
16 directly affect the future of Broadway and all  
17 live theatre, so we thank Council Member Brewer  
18 and the other distinguished members of this  
19 Committee for the opportunity to share our  
20 thoughts and concerns with you. There is no other  
21 assembly of theatres in the world as well  
22 respected for the quality of its productions as  
23 the Broadway community. Each year we host  
24 millions of tourists coming to New York from all  
25 over the world to experience Broadway and see the

lights of Times Square, which translates into millions spent on hotels, taxis, gifts, restaurants, and all other types of secondary spending. Broadway is essential to our economy. We are responsible for infusing New York City with over five billion dollars a year and creating the equivalent of nearly 45,000 jobs in the metropolitan area. As you may recall, the City's Comptroller estimated a \$38,000,000 loss in local tax revenue during last year's 19-day stagehand strike, while other public reports suggested that overall spending in the city was down \$17,000,000 per day during that period. Each year, touring Broadway visits nearly 250 North American cities, bringing the opportunity to experience the lives shows only Broadway can deliver to countless theatre fans who many never get the chance to visit New York. Our most recent studies suggest that including ancillary spending, touring performances contribute to over three billion dollars of spending nationwide each year. Approximately 12% of that money returns to New York, but the bulk of the spending supports the economies of the cities presenting touring

1  
2 Broadway. No industry more so than live theatre  
3 utilizes and relies on wireless microphone  
4 technology in its daily operations. We have  
5 devoted the past three decades to building on the  
6 dynamic staging and vibrant performances afforded  
7 by the freedom of wireless microphones. Everyone  
8 is aware that actors wear wireless devices to run,  
9 dance and sing without the need for cumbersome  
10 microphone wire. But few realize that wireless  
11 systems are integral behind the scenes.

12 Musicians, technicians, stagehands, stage  
13 managers, in fact nearly every show participant  
14 uses a wireless device and all of motorized stage  
15 equipment is operated wirelessly. Each night,  
16 productions like The Lion King, Wicket, Spamalot  
17 and Jersey Boys use up to 70 unique wireless  
18 channels to bring to life the performances that  
19 audiences expect and deserve. Managing Broadway's  
20 wireless operations is enormously complicated and  
21 our wireless systems may be gravely threatened by  
22 the introduction of proposed handheld devices,  
23 which would transmit on the bandwidth we occupy,  
24 but at a much higher power. With direct line of  
25 site a typical wireless signal on Broadway will

1  
2 carry only 125 to 150 feet. Add obstructions like  
3 performers, patrons, set pieces and walls, many  
4 reinforced with steel to contain wireless waves,  
5 and a wireless signal may not carry more than 80  
6 feet. In addition, our sound engineers constantly  
7 coordinate with other productions and scan the  
8 area for available bandwidth to reduce possible  
9 interference from local broadcasters. These new  
10 devices could effectively overpower our signals  
11 and cause our transmitters to cut out mid  
12 performance. Because we operate at extremely low  
13 power, unlike TV broadcasters, our productions do  
14 not fall within the FCC's category of licensed  
15 users. However, all of our wireless equipment is  
16 certified by the FCC as having been manufactured  
17 in accordance with Federal Broadcast Guidelines,  
18 and we do not operate on frequencies the FCC has  
19 cleared for public safety. Prior to a show's  
20 opening, our highly skilled technicians spend  
21 weeks coordinating frequencies with other theatres  
22 and local television broadcasters to ensure  
23 interference is never an issue. In all the years  
24 Broadway and touring Broadway have been operating,  
25 the FCC does not have a record of a single

1  
2 complaint filed by television or radio station  
3 about interference from a Broadway show. In  
4 essence, if you will, Broadway is seven up. We  
5 have never interfered with emergency transmissions  
6 and we never will. In an effort to safeguard  
7 white space users from interference from new  
8 devices, the FCC asked manufacturers to submit  
9 proposed spectrum sensing devices for review,  
10 devices designed to refrain from transmitting when  
11 in close proximity to another wireless source.

12 The FCC scheduled tests all over the country and  
13 under a variety of circumstances. For the final  
14 test, FCC engineers spend two days at Broadway's  
15 Majestic Theatre where Phantom plays, taking  
16 readings in and around the theatre before and  
17 during a performance of Phantom. Despite some  
18 published hyperbole to the contrary, neither of  
19 the two tested devices adequately detected  
20 operating microphones at any testing phase. One  
21 device presented by a Singapore-based firm called  
22 I2R consistently missed active wireless channels,  
23 while a device offered by Phillips showed false  
24 positive time and time again. An industry like  
25 Broadway, which relies on clear reliable wireless

1  
2 transmissions, cannot support introduction of new  
3 white space devices within these results. In real  
4 world terms, a new device activated on 6th Ave.  
5 may not detect a signal emanating from a nearby  
6 Broadway theater and decide it's safe to transmit.  
7 But once activated, the new device's signal will  
8 interfere with that Broadway theatre's wireless  
9 system and affect the show's sound quality. We've  
10 heard new device proponents use terms such as  
11 enhanced spectrum sensing, beaconing and a belts  
12 and suspenders approach, which simply piles  
13 unproven technology on top of unproven technology  
14 to hide significant technical flaws in the devices  
15 and inherent limitations of the white space  
16 frequencies. One channel simply cannot be  
17 occupied by two transmitters, and available white  
18 space is already limited. Unfortunately no high  
19 tech terminology can skirt these constraints.  
20 Then we must consider the question of who would  
21 bear the burden of purchasing any equipment  
22 current users would be asked to obtain to help  
23 support the introduction of new devices. Again,  
24 we thank you for this opportunity. The Broadway  
25 League is happy to work with the City Council, the

2 FCC and the members of the White Space Coalition  
3 towards developing a reasonable, workable solution  
4 to this complex problem. However, we do not  
5 believe new devices should be considered for the  
6 marketplace unless and until technology permits  
7 national use of the white space without  
8 interference to current users. Therefore, we  
9 support Resolution 1613 and we ask the Committee  
10 to vote yes. Thank you.

11 CHAIRPERSON BREWER: Thank you very  
12 much. You certainly answered the question, so  
13 thank you. We've been joined by Council Member  
14 Oliver Koppell from the Bronx. Oliver, we're in  
15 the first panel, talking about Broadway and the  
16 issues regarding the white space. I think what  
17 you talked about was how there is great  
18 coordination before every production, and I'm just  
19 wondering, does that go on in every instance? And  
20 is that also true of some of the Off-Broadway  
21 shows as well as the Broadway shows? In other  
22 words, is it across the board?

23 HEIDI MATHIS: I think it more  
24 applies to Broadway where they are so densely, you  
25 know, one theatre right on top of the other. I

1  
2 think it's less of an issue for Off-Broadway to  
3 coordinate quite that closely, but I think that  
4 they do to the extent they need to.

5           IRA MONT: That's accurate. And  
6 the sound shops that develop these systems before  
7 they're even delivered to the theatres are also  
8 speaking with one another. They know the  
9 frequencies. There are several shops that provide  
10 this equipment and support the sound design teams,  
11 and they all work with each other, knowing I'm  
12 going into this theatre, I've got this for this  
13 length of time. The point about touring also is  
14 very key, because the systems are put together in  
15 the sound shops and they know the bandwidth  
16 they're going to be in, but then they arrive in  
17 the venue in a city they haven't been to for many  
18 months or ever with this particular show, and they  
19 have a lot of testing to do to make sure those  
20 frequencies are all clean. They might have to  
21 make some adjustments. It would be very difficult  
22 if they arrived and found that they were  
23 essentially locked out of a portion of the  
24 bandwidth that was necessary. It would make it  
25 very, very complicated.

1  
2 HEIDI MATHIS: Also, touring  
3 Broadway had the additional consideration that  
4 Broadway has, which is usually touring Broadway  
5 houses in addition to Broadway houses are in the  
6 central city district, which is frequently near  
7 other broadcasters. Certainly in the case of  
8 Broadway you have ABC, NBC, CBS, MTV is right  
9 across Shubert Alley from us. And that  
10 concentration of white space usage is one of the  
11 other reasons why Broadway has to balance more,  
12 because of where we are geographically located  
13 versus Off-Broadway. They are not surrounded by  
14 as many broadcasters.

15 LAURIE BASKIN: And I think I heard  
16 you begin to ask earlier how do performing arts  
17 organizations pay for this equipment. In the non-  
18 profit world it's not all at once. It's something  
19 where you budget a little bit every year and, you  
20 know, with time and hopefully good budgets and  
21 fundraising is going well and so forth, you buy  
22 one piece of equipment a year and you slowly build  
23 to the capacity that you need to fully present  
24 your performances. If change requires changeover  
25 of all of the equipment, you know, at a certain

1  
2 date and time, we're sunk.

3 CHAIRPERSON BREWER: And how long  
4 does it take, for instance, you know, to put all  
5 that equipment together for a particular company?  
6 In other words, is it something that you can-- you  
7 have also a licensed person who's working with  
8 you? Obviously Local 1 is working on Broadway.  
9 How long does it take to get a Broadway show, for  
10 instance, calibrated? And then with some of the  
11 smaller shows, how do they coordinate with some of  
12 these other discussions that are going on?

13 IRA MONT: On Broadway, when a  
14 Broadway show is opening, especially a musical,  
15 which is certainly larger than a play in terms of  
16 its sound needs, the sound shop will start putting  
17 the package together anywhere from four to eight  
18 weeks prior to the equipment being required to be  
19 in the theatre, which is at least two to four  
20 weeks prior to the performers arriving at the  
21 theater to begin their two weeks of technical  
22 rehearsals before the audience arrives. So the  
23 beginning of the process is really a minimum of  
24 three months prior to a first public performance  
25 where the audience is going to experience the

1  
2 performance. So it's a long and complicated  
3 process. And clearly, although there's a lot of  
4 legwork done, once the equipment actually arrives  
5 in the theatre, very often adjustments need to be  
6 made from what was preset at the sound shop  
7 because of what you find when you arrive in the  
8 building.

9 LAURIE BASKIN: And then the--

10 CHAIRPERSON BREWER: [Interposing]  
11 Do you need to make adjustments daily or is that  
12 something that once it's made it sticks for the  
13 show?

14 IRA MONT: Adjustments are often  
15 made daily, especially on the-- I don't understand  
16 the specific technology. The communications  
17 amongst the stage crew and the stage managers seem  
18 to remain rather stable to some degree, although  
19 we're often-- we refer to it as being stepped on.  
20 You're listening and calling cues and all of a  
21 sudden you hear someone, you don't know who it is,  
22 talking in your headset. And that's an accidental  
23 crossover. And it could be from another theatre  
24 during their load in process. It could be from  
25 occasionally a cab driver driving by. The

1  
2 wireless microphones that the actors use are  
3 tested; each individual frequency is tested before  
4 every performance and occasionally does need  
5 adjustment.

6 CHAIRPERSON BREWER: Did you want  
7 to add something? Okay. I had some experience  
8 because LaGuardia High School is in my district  
9 and for their main show, somehow the microphones  
10 got lost and we ended up calling every shop in New  
11 York, we got 46 of them onstage. I never had such  
12 an experience in my life. So I know what you're  
13 going through. Oh my goodness. The Principal and  
14 I sat in the back and we prayed the entire time.  
15 My other question is this cost issue; obviously  
16 the best of all would be what you said in terms of  
17 your ending statement where we want to have  
18 devices that are able to be used effectively; we  
19 want the television to be able to not be  
20 interfered with and we want Broadway and every  
21 other show not to be interfered with. That's our  
22 goal. And so the question is in that scenario, it  
23 still would make sense, if that scenario holds,  
24 again, more testing, you know, gathering all of  
25 your evidence-- it would make sense then for you

1  
2 not to be licensed into the future, because that  
3 would end up costing more. Is that sort of what  
4 you're saying? I'm just curious about that aspect  
5 of it. Or, it doesn't really matter as long as  
6 the cost is low and you have no interference.

7 HEIDI MATHIS: Well, it is a matter  
8 of cost; that is paramount. However, you have to  
9 consider the administration of it and who really  
10 is the end user. The frequencies change with each  
11 show that comes in and out of a theatre. It  
12 changes with each producer. If you have an  
13 understudy go on, is that the end user? Is the  
14 performer the end user? It would be very, very  
15 difficult to administrate, and you also have to  
16 consider the public good that we have established  
17 and developed over the years. And to eliminate  
18 that over a licensing issue would be a misguided  
19 choice.

20 CHAIRPERSON BREWER: Okay. And  
21 then I know you talked about it, but have you ever  
22 received, I think you said not, any complaints for  
23 interfering with broadcast television, reception  
24 or with any wireless microphone? I don't think  
25 that's ever happened. And when you tour in other

1  
2 places, I think somebody talked about the fact  
3 that Las Vegas is not allowing any devices now,  
4 but when you tour in other places, is there  
5 interference in other locations or you've never  
6 had a problem?

7 HEIDI MATHIS: There hasn't been a  
8 problem that I know of. And you also have to  
9 consider, Vegas has a concentration of theatres.  
10 It's a little more spread out than Broadway--

11 CHAIRPERSON BREWER: [Interposing]  
12 Much more.

13 HEIDI MATHIS: But they also have,  
14 they have perhaps more danger involved in that  
15 there's more circus like spectacle, there's fire  
16 and flying in a lot of their shows, and all of  
17 that is guided by wireless mics. So it's  
18 extremely dangerous.

19 CHAIRPERSON BREWER: Okay. All  
20 right. Any other questions? Council Member, any  
21 questions? Thank you all very much. I really  
22 appreciate this and I appreciate making the time  
23 and the effort.

24 [Pause]

25 CHAIRPERSON BREWER: Okay. And the

1  
2 next panel is Marc Berejka from Microsoft and  
3 Stuart Overby from Motorola.

4 [Pause]

5 CHAIRPERSON BREWER: Welcome. You  
6 can do either order you prefer, it makes no  
7 difference. And I probably pronounced everybody's  
8 name wrong, so go ahead. Thank you for coming.

9 [Pause]

10 CHAIRPERSON BREWER: It's old  
11 technology.

12 STUART OVERBY: Yes. It's wired  
13 microphones, I see.

14 CHAIRPERSON BREWER: It's really  
15 old.

16 STUART OVERBY: Good morning,  
17 Councilwoman Brewer and Councilman Koppell. Thank  
18 you for inviting Motorola to participate in this  
19 hearing on TV white space and on the important  
20 issue of protecting wireless microphones for  
21 Broadway, which of course is one of New York's  
22 most important businesses. Motorola has developed  
23 technology that we believe can provide the answer  
24 and allow TV stations, wireless microphones and TV  
25 white space devices to coexist in the spectrum

1  
2 without interference. Before I say much more  
3 about that particular technology, let me just  
4 point out, Motorola is in the midst of celebrating  
5 our 80th year of innovation and communications.  
6 And these innovations included the first public  
7 safety radio on a police car was 70 years ago;  
8 portable cell phones while most people were  
9 looking at designing cell systems as mobile rather  
10 than portables; and the system that supported  
11 communications when the US landed on the moon. We  
12 believe that TV white space provides the  
13 opportunity for new innovation on the horizon, and  
14 that's cognitive radio technology, and that's  
15 basically technology that's smart enough to find  
16 the vacant gaps in the radio spectrum and operate  
17 on those gaps without interfering with current  
18 operations such as wireless microphones used by  
19 Broadway. All wireless communications require the  
20 foundation of radio spectrum to operate, just as  
21 your home has to have a foundation before you  
22 build the rest of the home. The TV band includes  
23 300 megahertz of spectrum, and to put that in  
24 perspective, that's 6,000 times the amount of  
25 spectrum used for each channel on which your

1  
2 police, fire departments and transit systems  
3 communicate. There are gaps in the 300 megahertz  
4 where the spectrum is not used for TV broadcast.  
5 Some of those gaps are used today of course in  
6 confined areas like Broadway theatres, houses of  
7 worship and concert venues for wireless  
8 microphones. However, we believe there are many  
9 of the spectrum gaps that still go unused. Also  
10 to kind of put this 300 megahertz into  
11 perspective, that's roughly about, you know, 1,500  
12 potential microphone channels. Not all of those,  
13 of course, can be used in the same area. My  
14 understanding from discussions with some of the  
15 wireless microphone experts is that 12 to 15  
16 channels of frequency as wireless mic frequencies  
17 are available for every TV channel that is set  
18 aside. Motorola has developed technology that can  
19 access these gaps in the spectrum while protecting  
20 TV broadcast and wireless microphone use. The  
21 technology is called Geo Location. And the basic  
22 approach is that before selecting a TV channel on  
23 which to operate, the TV white space device would  
24 access information on a database on which channels  
25 are used and which are vacant in a given area.

1  
2 The information on TV stations is already in the  
3 FCC's database and we've been discussing this  
4 issue with wireless microphone experts and they've  
5 agreed that one of the best ways to protect  
6 wireless microphone use is to then designate some  
7 channels in the database in each market for  
8 wireless microphone use, in which TV white space  
9 devices would not operate. Further, if additional  
10 wireless mic channels are needed beyond those  
11 designated on a nationwide basis, supplemental  
12 channels could be entered in the database for  
13 protection in a given area, for example Broadway.  
14 We all need to understand that, some of the  
15 previous panelists talked about the range of the  
16 wireless microphones that are used in the TV  
17 spectrum is very short. And for example I think,  
18 you know, a channel that might be used on Broadway  
19 for wireless microphones could be reused in the  
20 Bronx for a TV white space device without any  
21 impact to Broadway. So that's one of the things  
22 to keep in mind. We believe this is a practical  
23 way to protect important operations currently in  
24 the band and at the same time open unused TV white  
25 space spectrum to help bring broadband to all

1  
2 Americans across the country, help make the  
3 industries more competitive and use the limited  
4 spectrum resources more effectively. We're  
5 working with the FCC to implement rules that meet  
6 all of those important goals. And that's kind of  
7 the gist of my prepared statement. I'd be happy  
8 to answer any questions that you have.

9 CHAIRPERSON BREWER: Thank you very  
10 much.

11 STUART OVERBY: Thank you.

12 CHAIRPERSON BREWER: Do you want to  
13 testify, sir?

14 MARC BEREJKA: Sure. For the  
15 record it's Marc Berejka.

16 CHAIRPERSON BREWER: Got it.

17 MARC BEREJKA: From Microsoft. I  
18 was coming in on the train today and I had an  
19 inspired thought. And so if you will indulge me  
20 I'll supplement my written remarks with an  
21 inspired thought I had today, and if you like I'll  
22 reduce these supplemental comments to writing for  
23 you. The thought I came up with is that it's  
24 really important for us in the end to reframe this  
25 discussion. And in the process I'm hoping that

1  
2 the Council will be amenable to reframing the  
3 resolution. Right now the way the debate's been  
4 framed it's been talked about as a zero sum games.  
5 The press loves zero sum games. They love the  
6 battles. As human beings we're prone to zero sum  
7 thinking frequently. It's us versus them, Wall  
8 Street versus Main Street, Uptown versus Downtown.  
9 But personally I feel that we're lucky that we  
10 live in a time when through a lot of hard work,  
11 innovation and collaboration we don't have to have  
12 zero sum outcomes. We can design and generate  
13 win-wins. And we can collaborate on a future  
14 experience that we share as opposed to our  
15 experience versus their experience. And I think  
16 as a technology representative I think this is  
17 really, really something that we excel at. You  
18 know, to reduce it to its basic, technology  
19 innovation is just about tool building. We build  
20 tools, the manufacturers of tools generate wins  
21 for themselves, but they generate wins for their  
22 users. And we're especially excited about the use  
23 of white spaces because we think these tools in  
24 the white spaces can help bridge the digital  
25 divide, both in urban areas and in rural areas.

1  
2 But the magic of high technology is that you can  
3 add winners to the mix, or at least avoid  
4 inflicting harm on others, so you can have win-  
5 win-win or win-win-win and at least no harm to  
6 other interested stakeholders. And so in this  
7 regard, Microsoft is supportive of different  
8 technologies, be it Geo Location or be it the  
9 beaconing that was referred to in the earlier  
10 panel as a means to protect Broadway and other  
11 theatrical operations. And we and others in our  
12 White Space Coalition are earnest about  
13 collaborating with the performing arts to the  
14 point where we're looking for ways to help  
15 legalize their operations. As indicated in the  
16 last panel, many of the operations currently are  
17 technically unlawful, and we're looking forward to  
18 a possibility of making a fix to that. So in this  
19 way we'd also just ask for folks from the Broadway  
20 Community to alter their perspective and share our  
21 perspective on win-win. And in the end we think  
22 that things like turning on a beacon to identify  
23 when you're operating a wireless microphone is a  
24 small burden to carry when you look at the  
25 benefits of extending wireless broadband to inner

1  
2 cities, be it Wireless Harlem or wireless Sterit  
3 City [phonetic] whether you're extending wireless  
4 broadband out onto an Indian reservation. So, at  
5 the very end of the day, the thought that came to  
6 me while I was riding in on the train this morning  
7 was that we have opportunity here. You know, and  
8 if there's one thing about New York City that  
9 we're supposed to cherish it's that it's a place  
10 for opportunity. In this issue in particular I  
11 hope that we can look for opportunity in a win-win  
12 form and not via combat and hyperbolic  
13 overstatement of fearful situations. So again,  
14 I'd like to ask the Council to consider reframing  
15 the resolution to frame it as a statement of  
16 opportunity, a statement for win-win outcomes, one  
17 that recognizes the value of Broadway, but also  
18 the value of Wireless Harlem and other operators  
19 like it. I think that with the application of  
20 smart technology, both Broadway and digital divide  
21 closing devices can thrive. Thank you.

22 CHAIRPERSON BREWER: Thank you both  
23 very much. We've been joined by Tish James, who  
24 is a Council Member from the great borough of  
25 Brooklyn. One question I have for both of you, if

1  
2 we're talking about this database that you talked  
3 about and about the win-win, which I think would  
4 be great; I tried to say that in my opening  
5 remarks, is we want Broadway, we want television.  
6 We want wireless devices to be able to bring  
7 opportunity to everybody. So the best scenario  
8 would be to have all of this work together. And  
9 the question is, is it possible? How would  
10 portable devices access the database of a  
11 broadband connection if something like that is not  
12 available in an area? I mean that was something  
13 that-- go ahead sir.

14                   STUART OVERBY: Yes, Councilwoman  
15 Brewer. The proposal that Motorola has put on the  
16 table is that any portable and mobile devices  
17 would be wirelessly tethered back to an access  
18 point, a TV white space access point. That access  
19 point would be connected, you know, through the  
20 internet to the FCC's database in this provision,  
21 so that if it loses that connection, then after  
22 some period of time the devices would go off the  
23 air as well. So there's some kind of fail-safe  
24 protection in there. I think in essence what you  
25 do is have the access point send-- could send

1 control signals to a mobile or portable device  
2 that's associated with it, the TV white space  
3 device, that lets it know which channel to  
4 transmit on. And so if-- again, I think the  
5 construction we've talked about is having let's  
6 say in the New York TV market area, you would  
7 enter in certain channels in the database that  
8 would always be fore wireless microphone. And so  
9 the TV white space device, when it accesses those  
10 databases, or that database, would know to stay  
11 off of those channels. In high use areas like  
12 Broadway, you could enter in for that, you know,  
13 maybe mile around Broadway or whatever the  
14 distance needs to be, you could also put in  
15 additional channels. I think you'd also do the  
16 same thing on a temporary basis just when you've  
17 got a sports-- like the super bowl or something.  
18 Obviously there's lots of kind of super scale  
19 events like that that use lots of wireless  
20 microphones and in-ear monitor systems and  
21 everything. However, what that does allow you to  
22 do is it doesn't prevent those channels from being  
23 used to bring broadband to all Americans in other  
24 areas or used in manufacturing plants, utilities  
25

1  
2 and others to be more competitive on their  
3 facilities to have video to be, you know, safer,  
4 to help work their machines and everything so that  
5 can be more economic and competitive in the world  
6 market. So there are lots of benefits to TV white  
7 space. We think we can do both and protect the  
8 wireless mic use. In essence, wireless mics are  
9 the first TV white space use. It's just been  
10 doing it on a manual basis, whereas the technology  
11 is now available to do it more automatically.

12 CHAIRPERSON BREWER: Do you think  
13 this would add a lot to the cost of the cultural  
14 world?

15 STUART OVERBY: Well, I think if  
16 you're putting them in the database, I mean I  
17 think the FCC could adopt rules that basically  
18 provides the opportunity to register-- I mean  
19 first of all, it would put some number of channels  
20 in the database that would be kind of a standard  
21 number of channels. And then if you needed extra  
22 channels, they'd provide an opportunity to  
23 register additional channels. And I can't imagine  
24 that would be that big of a burden.

25 CHAIRPERSON BREWER: Obviously

1  
2 we're looking at a November timeframe, if that's  
3 what the FCC carries out. Do you think that it  
4 would be possible in order to support a win-win  
5 for everybody to have more time to work out all of  
6 these issues? What do you think about this  
7 timeframe that the FCC has put forward?

8           MARC BEREJKA: I actually think  
9 it's long overdue for the FCC to act. The FCC  
10 initiated this proceeding several years ago, and  
11 honestly has been slow in making progress on it.  
12 And we're excited about the prospect of a  
13 resolution come November, December; and from the  
14 high tech community's perspective, we fear that if  
15 the FCC does not continue to move at pace like it  
16 is now, that with the changeover in administration  
17 and potential changes in Commissioners, etcetera,  
18 we'll be pushed back by another year, if not  
19 longer. It's just the way things work down in DC.  
20 And that's another year lost in terms of  
21 innovating and rolling out service to people who  
22 need cheaper Internet access.

23           CHAIRPERSON BREWER: Okay.

24           STUART OVERBY: One other point on  
25 that. The decision before the end of the year by

2 November could always look forward to actual use  
3 of the TV white space devices starting when the  
4 digital TV transition ends on February 17th, 2009.  
5 I think that's the concept of TV white space, is  
6 that it's, you know, it's when the DTV transition  
7 is done, which again is mandated at February 17th,  
8 2009. So the FCC could reach a decision in  
9 November or by the end of the year that says  
10 here's what the rules are going to be, and actual  
11 use begins February 2009.

12 CHAIRPERSON BREWER: Council

13 Member--

14 MARC BEREJKA: [Interposing] I

15 think--

16 CHAIRPERSON BREWER: [Interposing]

17 I'm sorry. Go ahead.

18 MARC BEREJKA: Okay. Another thing

19 I'd like to point out is that, this might sound a  
20 little bit too legalistic, but from the FCC's  
21 perspective the white spaces devices that the high  
22 tech community is looking forward to building and  
23 that we're supporting rules around, they will  
24 operate on what's called a secondary basis. And  
25 the FCC will not certify equipment unless-- they

1  
2 will not certify equipment that operates on a  
3 secondary basis, unless that equipment can  
4 demonstrably apply with interference mitigation  
5 rules. So what we're really talking about here I  
6 don't think is, again, yes or no, either or.  
7 We're talking about under what conditions. Under  
8 what conditions should white spaces devices be  
9 permitted to operate? And on this score I'd like  
10 to point out that in the UK the regulator Ofcom  
11 has already affirmatively said that they are going  
12 to permit white spaces devices. And the London  
13 theatre district is a healthy theatre district,  
14 and the UK regulators are just as concerned as you  
15 folks are about protecting those operations. So  
16 again, you know, getting back to my theme of win-  
17 win here, it's really not yes or no; it's how.

18 CHAIRPERSON BREWER: Council Member  
19 Koppell, you had something you wanted to say?

20 COUNCIL MEMBER KOPPELL: I'm a  
21 little bit confused over; maybe we shouldn't say  
22 win-win and those phrases because they confuse me.  
23 I don't understand what they mean exactly and I  
24 think that they don't add to the discussion, they  
25 just create confusion. I don't see what's wrong

1  
2 with the resolution as it reads right now; because  
3 it says there is a concern that if you open up  
4 this white space to new devices that that will  
5 interfere with television broadcasters, performing  
6 artists, professional sports leagues and incumbent  
7 wireless microphone users. There's a concern over  
8 it. And all the resolution says is that those  
9 concerns have to be addressed before there is some  
10 regulatory change, which sounds a little bit to me  
11 like deregulation. And if you want to study  
12 whether deregulation should be hastily entered  
13 into, I think that the events of recent weeks and  
14 days illustrate that that's not a good idea. So  
15 forgetting about win-win or win-lose or zero sum  
16 games and looking at the resolution, it says  
17 before the FCC shall deregulate, which it sounds  
18 like they're doing at least to some degree, these  
19 legitimate concerns of important industries should  
20 be taken into account. If the gentleman from  
21 Motorola is correct, there can be a compatible use  
22 of the portable devices; and that's fine. I'm not  
23 opposed to it if it can be done. And I don't  
24 think there's anything wrong with asking the body  
25 that regulates the use of these devices and

1  
2 regulates the use of the broadcast spectrum to be  
3 particularly sensitive to the concerns that the  
4 resolution addresses. So, I don't quite  
5 understand. If you want to answer that, you can;  
6 but I don't understand why you shouldn't actually  
7 say, yes, that's fine. That resolution is fine,  
8 we think we have the answer and we'll satisfy the  
9 FCC. If you can't satisfy the FCC as this  
10 requests, then the FCC shouldn't go ahead.

11 MARC BEREJKA: So I'll take that  
12 on; I'm happy to. Thank you. I think at this  
13 stage in the deliberations after many years of FCC  
14 process, we can safely say that the deliberative  
15 process down there in DC has become highly  
16 politicized. We've moved away from the technical  
17 merits and it has become highly politicized. And  
18 as a natural outgrowth of that, I'm hoping it  
19 won't shock you that I believe this proceeding  
20 itself is highly politicized. And unfortunately  
21 what I find in reading the draft resolution is a  
22 lack of balance. It reads as a political  
23 statement that incorporates some of the biases and  
24 perspectives of the panel that just testified.  
25 And my suggestion is that a future version of the

1  
2 resolution recognize the balance of equities, the  
3 balance of the equities of wireless microphone  
4 users today and the equity interest of people who  
5 today cannot afford broadband service, but who we  
6 hope will be able to afford broadband service  
7 either in this city, any other city or across  
8 rural America because of technologies used in the  
9 white spaces; so recognizing that this document is  
10 a political document and not a technical one, the  
11 request is that it be scrubbed to make it more  
12 balanced.

13 COUNCIL MEMBER KOPPELL: If I may,  
14 I'm sorry. I just would say I would certainly  
15 look at wording that you might suggest. I don't  
16 think the suggestion of the Chair is to retard  
17 progress in this area, because I know she's deeply  
18 committing to increasing use of technology.

19 MARC BEREJKA: So, I think to go  
20 down one more layer, I think it's important to get  
21 on the record for you that while there are  
22 technical issues at stake here, not all the  
23 technical issues are being carefully and I'll say  
24 accurately characterized. That's the province of  
25 the FCC. That's the province of technical

1  
2 companies and technical experts to discuss with  
3 the FCC. And so what really concerns me is that  
4 as we sit up here in New York City, some of these  
5 technical inaccuracies, which are being used for a  
6 political agenda, are moving their way into the  
7 thinking around the resolution. And so I'd much  
8 sooner Council spend a good deal of time being  
9 briefed on the technical issues than, you know,  
10 frankly work off the written testimony that's been  
11 submitted by either side. I'll just give you one  
12 example from the immediate past panel. A  
13 statement was made on the immediate past panel  
14 that no two signals can operate on the same  
15 channel. That is inaccurate. Today, everybody  
16 can drive listening to FM radio, and every FM  
17 radio station is broadcasting that they have now a  
18 digital offering. The digital offering and the  
19 traditional analog offering of an FM broadcast  
20 operate on the same channel. Radio frequencies  
21 can be used very adeptly, as the gentleman from  
22 Motorola testified. There was also a suggestion  
23 that licensing would be difficult. I have not  
24 practiced licensing for many years, but when I  
25 did, for non-profits and for public safety

1  
2 entities, the fee for a license was \$35 for a  
3 five-year license. And you could license a  
4 geography; you did not have to license a  
5 particular use. So a single theatre could own a  
6 license as opposed to an individual performance.  
7 So there are these levels of factual matters that  
8 I think need to be looked at closely if you're  
9 going to make an informed resolution, or if you  
10 just frankly want to look at the social equities.  
11 You know, I do think you end up at a net balance  
12 where the social equities of what Broadway and  
13 other entertainment industries have to offer are  
14 valuable, but so are the social equities of lower  
15 cost broadband for underserved people.

16 CHAIRPERSON BREWER: Council Member  
17 James, did you want to say something? Okay. What  
18 exactly do these devices look like in terms of the  
19 future? In other words, we're talking about  
20 devices that would in fact be compatible, that's  
21 our win-win situation; what would they actually  
22 look like for the user who is able to then access  
23 much more broadband?

24 MARC BEREJKA: So my expectation is  
25 that the devices, the white space devices don't

1 look much different than today's WiFi devices.  
2  
3 And if we go back in time we can, some of us, can  
4 remember the first WiFi devices. They plugged  
5 into a personal computer via a card and they had a  
6 little antenna baked into that card and that was a  
7 transmitter/receiver, much like that device there  
8 has probably a Bluetooth dongle if you can see the  
9 little gray thing hanging off that. But over time  
10 the price of the technology comes down, it gets  
11 integrated into the hardware and then you don't  
12 even notice it as a user. So for example, my cell  
13 phone, you know it operates on licensed  
14 frequencies, built by Motorola by the way, it  
15 operates on licensed frequencies, but it's also  
16 got in this little device, it's got two little  
17 wireless radios, excuse me, unlicensed radios as  
18 well. I have WiFi in here and I have Bluetooth in  
19 here, so in this little guy, Bluetooth, WiFi plus  
20 cellular. And so you can imagine any form factor,  
21 it could be this guy, that guy, that guy, this  
22 guy. You know, they could all be white space  
23 devices. And initially it would be through a plug  
24 in, but eventually they'd be baked in.

25 CHAIRPERSON BREWER: One question

1  
2 would be say for instance you have that device and  
3 in use and it does interfere with television  
4 reception or with some of the Broadway  
5 microphones, how would you get those devices back  
6 out of the market? How would the Broadway folks  
7 feel secure?

8 MARC BEREJKA: So the way these--

9 CHAIRPERSON BREWER: [Interposing]  
10 I'm just saying for instance.

11 MARC BEREJKA: Yeah, for instance,  
12 I really think that that's a hypothetical that  
13 involves a bit of a stretch.

14 CHAIRPERSON BREWER: Okay.

15 MARC BEREJKA: You know, no  
16 consumer is going to open up this thing and try to  
17 figure out where the WiFi chip is or where the  
18 Bluetooth chip is. And if the consumer does open  
19 up this thing and try to mess with the WiFi or the  
20 Bluetooth chip, they're going to break it. And  
21 so, as I said earlier, the FCC will only be  
22 certifying devices that meet the interference  
23 mitigation requirements.

24 CHAIRPERSON BREWER: The other  
25 question I had is because we are, in New York,

1  
2 focused on Broadway and I think you all know that  
3 we want to make sure that Broadway is secure,  
4 would all devices carry beacons or would that be  
5 something that the theatre industry would be more  
6 focused on?

7 STUART OVERBY: Well let me just--

8 CHAIRPERSON BREWER: [Interposing]  
9 In your scenario.

10 STUART OVERBY: Yeah. Let me just  
11 address that. We've talked about beacons as well.  
12 And we're not talking about this morning with the  
13 database; that's different than beacons.

14 CHAIRPERSON BREWER: Correct.  
15 They're two different ones.

16 STUART OVERBY: The beacon is  
17 basically, it's a device that is-- could be  
18 similar to a wireless microphone, but it's a  
19 higher-powered device so it could be sensed more  
20 easily than the very, very low power wireless  
21 microphone transmitter. I mean we've built a  
22 prototype beacon; we provided it to the FCC,  
23 basically built it off of a platform of a two-way  
24 radio. So it's not an issue of building, and I  
25 think the question is, you know, where is it

1  
2 practical to deploy them? When is it not  
3 practical to deploy them? Clearly that's one  
4 answer. If you wanted to, say in a specific area,  
5 I need more channels than those that were set  
6 aside everywhere. I could put up a beacon and say  
7 okay, I'm also using these channels. That's one  
8 solution. The other solution is to put those  
9 channels for a confined area in the database. So  
10 I think either way would work. Based on some of  
11 the discussions we've had with, again, wireless  
12 mic experts and broadcast personnel and all, you  
13 know, what I'm gathering is it may be more  
14 practical in some cases to just put the added  
15 channels in the database as opposed to putting up  
16 a beacon. But both-- technically either one could  
17 work; just which one works practically.

18 CHAIRPERSON BREWER: And the  
19 beacons themselves, would they interfere with  
20 anything or not? Because they have to also  
21 operate wirelessly--

22 STUART OVERBY: [Interposing] Well  
23 the beacons themselves also have to operate--

24 CHAIRPERSON BREWER: [Interposing]  
25 Operate wirelessly.

2 STUART OVERBY: --on a portion of  
3 the spectrum. So they would operate-- if I'm  
4 using some of the frequencies, the wireless mic  
5 frequencies in channel 43--

6 CHAIRPERSON BREWER: [Interposing]  
7 Right.

8 STUART OVERBY: I'm picking a  
9 number out of the air.

10 CHAIRPERSON BREWER: Yeah.

11 STUART OVERBY: Let's say TV  
12 channel 43. And if I'm using some wireless mic  
13 frequencies within channel 43, I would also put up  
14 a beacon that's somewhere within that channel that  
15 would then radiate a higher powered signal than a  
16 wireless mic usually radiates and basically that,  
17 you know, if you had TV white space devices  
18 sensing those beacons, it would say oh. It would  
19 sense that it cannot operate on channel 43.  
20 Again, that's one approach. The other is to put  
21 channel 43 for Broadway into the database as an  
22 example.

23 MARC BEREJKA: So, to give you a  
24 practical example of this concept of co-channel  
25 operations, the field test that they performed at

1  
2 FedEx field was interesting to, you know, all the  
3 geeks that were there. So, at FedEx field when  
4 they were playing this football game, the referees  
5 and everybody, they were using their wireless  
6 microphones. FedEx Field is kind of in a suburban  
7 area. You know, it's surrounded by parking lots  
8 and all, but beyond the parking lots is a  
9 residential area. In the residential area, to the  
10 FCC's knowledge, nobody ever complained that they  
11 were losing TV reception.

12 CHAIRPERSON BREWER: All right.

13 MARC BEREJKA: But it turned out  
14 that in FedEx Field during this day of testing,  
15 the wireless mics were operating on occupied TV  
16 channels. So inside FedEx the Refs were doing  
17 fine on a TV channel that outside FedEx, people  
18 were receiving regular TV on. There was co-  
19 channel operations and everybody was happy.

20 CHAIRPERSON BREWER: So what your  
21 point is that that could be across the board for  
22 the future, that that would--

23 MARC BEREJKA: [Interposing] It's  
24 workable.

25 CHAIRPERSON BREWER: In other

1  
2 words, if there was a larger residential  
3 population, like in New York City because, with  
4 all due respect to Maryland, there are more of us  
5 here, and with a co-terminus so to speak  
6 situation, do you think that the experiment that  
7 existed Maryland could also be applicable in New  
8 York where there are so many more televisions, I  
9 think eight million televisions or whatever the  
10 number is, as well as whatever we're planning for  
11 devices? Do you think that's possible, even  
12 though it's a much more congested area? In other  
13 words, we have more televisions here. We have a  
14 lot of ball fields here. We have a lot of other  
15 uses that may not exist in more suburban rural  
16 areas. So comparing us to the suburban or rural  
17 area, do you think you'd have the same situation,  
18 or the same non-problem?

19                   STUART OVERBY: I mean I think  
20 with, first of all, you know the FCC has to  
21 develop the rules under which TV white space  
22 devices would operate. So, if the FCC puts in  
23 channels that are designated for wireless mics in  
24 the rules-- again, some may be over the broad  
25 whole market area. Some may be extra channels

1  
2 that would be put in just on Broadway. And they  
3 would also define, I think there's work, probably  
4 calculations, they can do-- some very smart  
5 engineers at the FCC, that can say oh, okay, if  
6 these extra channels are put in Broadway, you can  
7 use them if you are a mile or more away or a half  
8 mile or more away. I don't know exactly what that  
9 number is off the top of my head. But you could  
10 determine that. And you'd factor in is it indoor  
11 use or is it outdoor use. I think one of the  
12 previous panelists noted that, you know, some of  
13 the signal is absorbed by the buildings and  
14 everything. That also works for signals coming in  
15 from TV white space devices. Some of it would be  
16 absorbed. So whether it's an outdoor event or an  
17 indoor event-- I mean those things, they can be  
18 calculated. And I think the FCC can do that and  
19 then the TV white space device would say oh, at  
20 this set of coordinates, you know, I cannot use  
21 this TV channel from within a mile, a half-mile or  
22 whatever the distance is.

23                   MARC BEREJKA: I think congestion  
24 in New York City is actually a good way to think  
25 about this problem holistically. One of the

1  
2 reasons why wiring schools or using today's WiFi  
3 in schools or in public housing today is expensive  
4 is because you don't want to put wires through  
5 cinderblock or it's expensive to do that. Also  
6 these buildings made of stone and steel  
7 reinforcements, they knock down signals. And so  
8 one of the advantages of the white space is that  
9 they do a much better job penetrating walls. So,  
10 that's-- you recognized this in your initial  
11 remarks, that's why we're excited about use of the  
12 white spaces, because you can get more reach. You  
13 don't have to worry about buying more equipment.  
14 If you're going to do WiFi you don't have to worry  
15 about drilling holes through walls if you're going  
16 to lay wire. At the same time, if you think about  
17 operations, you know, in midtown, if you have  
18 somebody speaking at my level in a theatre using  
19 the wireless microphone, effectively what the  
20 beacon does is it screams, and it screams at a  
21 level that then goes beyond, through the wall, to  
22 the surrounding area, and it's up to the FCC to  
23 decide how big that surrounding area could be, but  
24 it screams and it penetrates outside the walls and  
25 basically says, don't use this channel, don't use

1  
2 this channel. But by the time you get past, I  
3 don't know, you know 80th St. or something like  
4 that, that scream will have dissipated. So north  
5 of there the white space would be available and  
6 you could operate a more robust wireless internet  
7 hub.

8 CHAIRPERSON BREWER: Council Member  
9 James?

10 COUNCIL MEMBER JAMES: I apologize  
11 for being late. And as someone who has advocated  
12 with this chair to address the technology divide  
13 in quote, unquote outer boroughs and quote,  
14 unquote inner cities, I mean I recognize your  
15 concerns and in fact are sympathetic and torn  
16 about this resolution. So my question to you is,  
17 ultimately is it your position to put off this FCC  
18 regulation and to put off this resolution until  
19 such time as prototypes are developed so that they  
20 can both coexist? Is that the bottom line?

21 MARC BEREJKA: No, my bottom line  
22 is that I'd prefer to work in deliberate fashion,  
23 and I think I speak for the rest of our commercial  
24 interests in the White Spaces Coalition, that we'd  
25 like to work in deliberate fashion to reframe the

2 resolution, but not do anything to slow down the  
3 FCC's process. The FCC's process has already been  
4 delayed by a number of years.

5 COUNCIL MEMBER JAMES: And do you  
6 have language for another resolution, an  
7 alternative resolution?

8 MARC BEREJKA: I believe that  
9 others who may be on the next panel may have  
10 offered up language. I personally have not.

11 COUNCIL MEMBER JAMES: Thank you.

12 STUART OVERBY: Just one additional  
13 point. We've had a number of discussions with the  
14 FCC over the last, you know, probably 18 months or  
15 so on this issue. And when we've talked with  
16 them, again, it's the same position we had here  
17 today, is that for TV white space to be  
18 successful, I mean you have to have the right  
19 rules for TV white spaces; but you also need to  
20 protect broadcast and wireless microphones. We  
21 said that from day one. And the discussions that  
22 I've had with the people at the FCC, I think it's  
23 clear that they understand that. I mean, so I  
24 don't think they-- I mean I think they're doing  
25 exactly, you know, they're wrestling with and

1  
2 doing exactly what your resolution suggests that  
3 they do, which is to find a way to authorize TV  
4 white space without it negatively impacting  
5 broadcast or wireless microphones.

6 COUNCIL MEMBER JAMES: And how  
7 would you--

8 STUART OVERBY: [Interposing] And I  
9 think that's exactly what they're doing.

10 COUNCIL MEMBER JAMES: And how  
11 would you describe the test that was performed at  
12 the Majestic Theatre in New York on August 12th?  
13 Was that successful, unsuccessful; how would you  
14 describe that?

15 STUART OVERBY: I wasn't at the,  
16 exactly at the test. So I'm probably not the best  
17 person to ask. I think, again, what we've talked  
18 about, the Geo Location technology we've talked  
19 about is not what the FCC has done most of its  
20 testing on. What they've done most of the testing  
21 on is sensing where I have to determine, I have to  
22 basically pick up a signal off the air. With Geo  
23 Location, basically you have things in the  
24 database and, you know, you determine that you  
25 cannot operate or should not operate on those

1  
2 channels. So I think it's a little more reliable.

3           MARC BEREJKA: I'm glad you re-  
4 raised the test at the Majestic though, because it  
5 points to another, I'll just say questionable  
6 statement from the prior panel. I won't defend  
7 the Singapore device. I think everybody in our  
8 Coalition recognizes that that device was not  
9 performing well and failed. But the Philips  
10 device, this is Philips Electronics, a major  
11 manufacturer, the Philips device, yes, it was said  
12 generated multiple false positives, which makes it  
13 sound bad. But actually, if it is bad, it's bad  
14 from the perspective of folks who are proponents  
15 of white space devices; because a false positive  
16 says that this channel is occupied, don't use it.  
17 So basically, you know, in my last comment I said  
18 that the white space device could pick up a  
19 screaming beacon and not operate. Basically the  
20 Philips device was picking up whispers, and so it  
21 was over sensitive. And if anything, it  
22 demonstrates the ability to sense very low signal  
23 in TV spectrum.

24           COUNCIL MEMBER JAMES: And last  
25 question; I'm sorry Chair. What was the basis for

1  
2 the delay, the delays related to the promulgation  
3 of FCC rules?

4 MARC BEREJKA: You know it's  
5 interesting; the history here is long and  
6 tortured. I'll give you the thumbnail sketch.  
7 The first FCC chairman under President Bush was  
8 Michael Powell, son of Colin Powell. And he  
9 doesn't look like it, but he's a geek. He's a  
10 geek.

11 CHAIRPERSON BREWER: [Off Mic]

12 MARC BEREJKA: No, because he's a  
13 lawyer, lobbyist, politician, right? He doesn't  
14 wear pocket protector like guys at Microsoft do.  
15 Nor does he come to work in cut off shorts and  
16 sandals. Those are the geeks I see. So, he was a  
17 big fan of spectrum reform, and in particular  
18 using spectrum reform to close the digital divide.  
19 And so he kicked off this proceeding. And as many  
20 of these proceedings go, it took time. And along  
21 the way he decided that he wanted to pursue other  
22 objectives personally, professionally. And so he  
23 moved out of the position and in the second Bush  
24 administration a new chairman came in. And the  
25 chairman sets the agenda. Basically the chairman

1  
2 moved this issue further down on his list of  
3 priorities. And it took lobbying by consumer  
4 interest groups and by tech companies to say, hey  
5 look, you guys are sitting on your hands, let's  
6 get this thing done.

7           STUART OVERBY: Just to add, the  
8 current Chairman Martin, I think indicated last  
9 week, I believe it was reported in Dow Jones that  
10 he is supportive of TV white space. And I think  
11 when we've talked with the technical people, I  
12 mean again, they're wrestling with these issues,  
13 but I think they have much of the information that  
14 they need to move forward.

15           COUNCIL MEMBER JAMES: And very,  
16 very last question, if in fact the rules were  
17 delayed, to what extent would this have on  
18 communities that obviously do not have access to  
19 broadband, such as the community that I represent?

20           STUART OVERBY: Well, you know, the  
21 OECD said that the US is 15th down on the list of  
22 countries with broadband penetration. And so, I  
23 think, you know, obviously everyone wants to move  
24 the US up the ladder on that broadband penetration  
25 as much as possible, so we can be more competitive

1  
2 in the global market. And delaying this-- you  
3 know once we have, we believe we have a solution  
4 that can address the wireless mic issues, can  
5 address protection of television and also allow TV  
6 white space to move forward. So we don't see any  
7 reason to delay, you know, actual implementation.  
8 And at the same time, there's a reason to move  
9 forward without any further delay, which is to  
10 move the US further up that ladder of broadband  
11 penetration.

12 CHAIRPERSON BREWER: I think even  
13 whenever it passes, we still have to get people  
14 computers, we have to get meaningful access, we  
15 have to get training, you know; and it costs  
16 money. So there's a lot of aspects to getting  
17 people real-- but you know, every bit is a step.  
18 But those are other impediments that we are  
19 working to try to deal with-- a long process.  
20 Just one final question, and I think you have  
21 answered this, but you do feel confident that the  
22 FCC has enough information to promulgate rules  
23 today so that your devices would not interfere. I  
24 mean, you feel that whatever timeframe they're  
25 under, that once they do that there would be

1  
2 enough rules promulgated after that. I know  
3 whenever we pass legislation here in the City  
4 Council, it's usually some months before there are  
5 actual implementations, because there have to be  
6 rules and regulations. That's true in all  
7 government. This is much more complicated than  
8 passing vending rules or many other aspects of  
9 City government. So, obviously you're working  
10 with the FCC, but do you feel the situation is  
11 possible to promulgate rules that would keep  
12 interference out?

13                   STUART OVERBY: Yes. I do. I  
14 think they have-- there are certainly, I mean  
15 getting information, Motorola's been to talk with  
16 them, I know Microsoft, others they're also  
17 hearing from, reputable companies like Shure;  
18 they're hearing from the broadcast representatives  
19 somewhere in the run of the day. So, I mean  
20 they've heard the different concerns I think, and  
21 they're mixing that together to put together rules  
22 that we believe will allow TV white space and at  
23 the same time, you know, protect broadcast and  
24 wireless mic use.

25                   MARC BEREJKA: So one of the things

1  
2 to bear in mind is that while my colleague and I  
3 and others sit under your spotlight today, this  
4 spotlight has been burning bright and intensely  
5 for quite a while in Washington, DC. In fact--

6 CHAIRPERSON BREWER: [Interposing]  
7 By all the phone calls I've been getting--

8 MARC BEREJKA: [Interposing] Yeah.

9 CHAIRPERSON BREWER: --I believe  
10 you.

11 MARC BEREJKA: But to give you a  
12 flavor for it, the major manufacturer, maybe the  
13 only major manufacturer of wireless microphones,  
14 Shure Corporation, has been doing a phenomenal job  
15 raising awareness about their concerns, to the  
16 point where in Washington, DC we not only see the  
17 appearance of Broadway interests, but we see the  
18 NFL, we see NASCAR, we see Hollywood and the TV  
19 broadcasters. Trust me, they carry a lot of  
20 political weight. So the FCC understands the  
21 magnitude of what's before them and the need  
22 therefore to have technical information they can  
23 rely on.

24 CHAIRPERSON BREWER: Thank you very  
25 much. We've been joined from Council Member James

2 Sanders from the borough of Queens and Council  
3 Member Bill de Blasio from Brooklyn. Thank you  
4 both very much.

5 MARC BEREJKA: Thank you.

6 STUART OVERBY: Thank you.

7 CHAIRPERSON BREWER: This was very  
8 informative and I appreciate your time. The next  
9 panel is Thomas Hillgardner, Association of Cable  
10 Access Producers; Mark Brunner from Shure  
11 Incorporated, which was mentioned earlier; David  
12 Donovan from MSTV and James Smith.

13 DAVID DONOVAN: Do you have any  
14 copies of your statement? Yeah, my written  
15 testimony. Stuart? Do you guys want some water?

16 THOMAS HILLGARDNER: I'm fine,  
17 thank you.

18 DAVID DONOVAN: Do you want some  
19 water?

20 [Pause]

21 CHAIRPERSON BREWER: Whomever would  
22 like to start, go right ahead. Just introduce  
23 yourself.

24 THOMAS HILLGARDNER: My name is  
25 Thomas Hillgardner, and thank you for hearing me

1  
2 today and thank you for having this important  
3 hearing. I'm speaking on behalf of the  
4 Association of Cable Access Producers, and also I  
5 believe all activists who are interested in more  
6 open access to the internet and a greater variety  
7 of media sources. We're calling on the City  
8 Council to reject the resolution or to reword it.  
9 We initially started, ACAP initially started as an  
10 advocacy organization and our focus was limited to  
11 public access television. But with the changing  
12 landscape of the media, we've gotten into other  
13 areas. And one of these changes is the adoption  
14 of digital broadcasting technology and that has  
15 brought along many changes in the industry and  
16 many efficiencies that permit more efficient use  
17 of radio spectrum. While it was necessary many  
18 years ago, as we are aware, for the FCC to set  
19 aside this space, it's valuable now and it can be  
20 put to a higher use than it's being put to now.  
21 The concerns that were addressed hear earlier by  
22 the Broadway folks and certainly by the  
23 broadcasters and the NFL, etcetera, etcetera, they  
24 are important. But I don't really-- we don't  
25 really believe that-- I've got to support the

1  
2 comments of the gentleman from Microsoft; it seems  
3 to be a win-win situation. I think that the  
4 situation is very much overblown. The current  
5 legislation appears to be an effort responding  
6 just to these narrow interests and preventing the  
7 opening of the spectrum for general use by the  
8 public. With regard to the field tests that were  
9 recently done, particularly with the Philips, and  
10 the point was previously made, false positives are  
11 not a problem. They're actually a problem for the  
12 maker of the device and that if anything, that  
13 these devices should work wonderfully and not  
14 interfere at all, at least the Philips device,  
15 would seem, from my judgment, would seem to have  
16 been proven by these most recent tests. It's time  
17 to end the digital divide. It's really important  
18 to do that. This is a way that a new technology  
19 can open up and more people will have access.  
20 Technology like Skype permits the immigrant  
21 communities of Queens, where I'm from, to be able  
22 to make very cheap telephone calls that otherwise  
23 they presently are making with very expensive  
24 prepaid phone cards that sometimes people get  
25 ripped off on. It will permit communication and

1  
2 it will improve the quality of life for immigrants  
3 and the poorest in our community. At the end of  
4 the day, these wireless communication companies,  
5 and some of the folks here, were not the people  
6 who elected you, these narrow interests; it's the  
7 people here that you've got to serve. So I'd ask  
8 you to consider those. Thank you very much.

9 CHAIRPERSON BREWER: Mr. Donovan?

10 DAVID DONOVAN: Thank you, Madame  
11 Chair and members of the council. My name is  
12 David Donovan. I'm president of MSTV. We are the  
13 engineering arm of the television broadcast  
14 industry. And I will submit my written statement  
15 for the record. But what I'd like to do is engage  
16 a conversation here. There has been a lot of  
17 discussion today about the digital divide. And  
18 one of the key issues as we're going forward right  
19 now with the digital transition, because we did  
20 much of the engineering work that underpins that  
21 digital transition is that if you allow  
22 unregulated unlicensed devices in the television  
23 band one of the key folks that are going to get  
24 interfered with are over the air digital  
25 television viewers. Why are we so concerned about

1  
2 this? In the old days with analog television, if  
3 you had interference you saw some wavy lines, you  
4 saw some sparkles, your dad's running a high-speed  
5 drill or a hairdryer in your house, you could deal  
6 with that. But when you get interference with  
7 over the air digital television, even as the FCC  
8 found, even the smallest amounts of interference  
9 can lock and freeze a picture. Now we have been  
10 involved in this for over a decade. It is in part  
11 because of our engineering working with the FCC  
12 that allowed channels 52 to 69 will now be given  
13 for WiFi, WiMAX uses, that spectrum is in the  
14 process of being auctioned off now, and also for  
15 public safety. What we're really talking about  
16 here are the remaining portion of the broadcast  
17 band. A third of it has already been given away.  
18 We're talking about the remaining two-thirds,  
19 channels 2 through 51. Now, there has been a lot  
20 of discussion here today that we can get broadband  
21 throughout New York City. And the purpose of  
22 using this spectrum of course is for long-range  
23 type communications. You can use-- this spectrum  
24 works very, very well for long-range  
25 communications, which makes it ideal for rural

1  
2 broadband. There is spectrum out in rural areas  
3 because nobody lives there. There are fewer  
4 television stations. There are fewer wireless  
5 microphone users. But when you get into New York  
6 City, it is incredibly congested. So when folks  
7 tell you that there is plenty of spectrum that can  
8 be used here, you have to dig a little deeper and  
9 look at the underlying engineering assumptions  
10 that say whether or not that spectrum is  
11 available. Let me explain just a couple of  
12 things. The interference that's going to occur is  
13 not the interference of the broadcast towers,  
14 broadcast antennas on Empire. That's not going to  
15 happen. The interference occurs on the back of  
16 your television set, in the rabbit ears on top of  
17 your television set or the antenna on your roof.  
18 Now how can a small device interfere with a  
19 television set? It doesn't make sense. Picture  
20 it this way, you're a lighthouse on the beach; if  
21 you stand near that lighthouse you see a huge  
22 light. But if I go a mile or two down the beach  
23 and I stand there with a flashlight ten meters  
24 away or ten feet away from you and I flash that in  
25 your eyes, you will see the flashlight before you

1  
2 will see the pin dot from the lighthouse. The  
3 interference that's going to occur to consumers is  
4 precisely that. It's how much signal are you  
5 getting to the back of your television set versus  
6 how much power or signal is coming out of an  
7 unlicensed device. And when you get into the  
8 personal and portable devices of the types we are  
9 talking about here, the interference risks are  
10 significant. They will come from your neighbors;  
11 they could come down the street. You won't know  
12 where that interference is coming from. So let's  
13 talk about two things here. Co-channel  
14 interference, can you operate an unlicensed device  
15 on the same channel folks are trying to watch?  
16 After the transition CBS in town here will be on  
17 channel 33. Can I operate an unlicensed device on  
18 channel 33 and will it cause interference? The  
19 answer is yes. And in fact, that co-channel  
20 interference will go for kilometers. I will get  
21 back to my friend from Microsoft's analysis that  
22 you can do that at the same time, because candidly  
23 from a technical standpoint, that's not quite  
24 right. If you have two signals coming from two  
25 different devices, one from a broadcast tower and

1  
2 one from an unlicensed device at the same time,  
3 that will cause interference; that interference  
4 will be for kilometers. But the second type of  
5 interference is what we call adjacent channel  
6 interference, that is when you buy a television  
7 set and you're trying to watch channel 33, can I  
8 put a device on channel 34 and operate on channel  
9 32? Whether that works depends on your television  
10 set. And the television sets manufactured today  
11 are unable to block out or reject those signals on  
12 either side. What does that mean? If you're at  
13 home or you're in an apartment and your next-door  
14 neighbor fires up one of these devices on channel  
15 34, it will interfere with your television  
16 reception. Now, will walls diminish this problem?  
17 I guess we get into sort of the questions of  
18 building codes; you get into the question of  
19 whether you can use these unlicensed devices near  
20 windows. It becomes an incredibly complex  
21 problem. But the key point here is that the  
22 interference will occur. So how do you avoid it?  
23 Everyone agrees there's interference. How do you  
24 avoid it? The first step was sensing, and that  
25 has been tested by the FCC for the last several

1  
2 years. Candidly, the tests that were conducted in  
3 Maryland indicate failure. Now the inability to  
4 sense ranges, the sensing error rate ranges  
5 anywhere between 27 to 37% for the devices that  
6 were tested by the FCC. We get to the question of  
7 is a false positive good. The reason why false  
8 positives should not be considered as being  
9 effective solutions is it's sort of like taking  
10 the SAT and you checked all the boxes off and then  
11 submitted and said yes, look, I got the right  
12 answer. If you make something so sensitive that  
13 it starts picking up everything from background  
14 noise to signals way far away, you know, hundreds  
15 of miles away, that's not a device you can sell.  
16 So as a result you have to make it less sensitive.  
17 And Philips has had four years to produce even a  
18 prototype lab device to work, and they haven't.  
19 Microsoft has submitted a number of devices; two  
20 of them failed in the recent tests, it just died.  
21 One died the year before. I2R, I think is the  
22 other, the Singapore device that has been  
23 submitted; that has also failed. So the ability  
24 to use sensing to differentiate between when a  
25 channel is being occupied and when a channel is

1 not being occupied, it just simply doesn't work.

2 On an adjacent channel, the FCC's own analysis

3 indicates that if you operate these devices on

4 adjacent channels you are going to cause

5 interference. I will get into some of the studies

6 that were mentioned, you know, particularly the

7 University of Kansas, we can talk about that. But

8 the bottom line is, is that if you operate on that

9 adjacent channel, you have a problem. Now,

10 Motorola will tell you that they have a device

11 that works just fine on the adjacent channel, your

12 technology that they're developing with Geo

13 Location. You need to dig a little deeper into

14 that, because what it says is this: I'm going to

15 develop a formula and that formula says that very

16 weak signals at the outer edges of a station's

17 contour, let's say in Westchester County or you

18 get out into Jersey where the station, the signal

19 is really weak, they will reduce their power. But

20 as I get closer to the broadcast tower, I will

21 increase my power. Okay? Here's the problem. In

22 highly congested metropolitan areas, folks are

23 getting their signals through rabbit ears, through

24 walls. You can't make that probabilistic

25

1  
2 analysis. Someone can be living a mile or two  
3 away from Empire State and get an extremely weak  
4 signal. So if you go down that road, you are  
5 going to have problems in high-density areas.  
6 Now, who gets hurt? The folks who get hurt here  
7 are several. First, your free over the air TV  
8 viewers in New York City; and your nationwide  
9 average, I mean you're running between 19% of the  
10 population, in some communities it's more than a  
11 third. In particular in Hispanic communities, in  
12 poor communities and with the elderly who rely  
13 very heavily on free over the air TV, they are the  
14 ones who are going to be most susceptible to  
15 damage here. The second folks who get hurt are  
16 you; it's all of us. And it's because with live  
17 news, during emergency situations, apart from  
18 folks not being able to get on their television  
19 set, we are using wireless microphones day in and  
20 day out not just at fixed locations, but around  
21 the city bringing live news and emergency events.  
22 The solutions that have been proposed to date, in  
23 particular the beacon, are not going to resolve  
24 those problems. Remember, if these devices can't  
25 sense a broadcast signal, how are they going to

1  
2 sense a beacon? The sensing piece is problematic.  
3 In addition, don't underestimate the problems with  
4 cable, the National Cable and Telecommunications  
5 Association just filed data with the FCC  
6 indicating that unless you limit the power of  
7 these devices to under ten milliwatts, I don't want  
8 to get too, you know, egghead on you here, but  
9 you're going to run and create direct pickup  
10 interference to cable systems. So if you look at  
11 where we are now, and I do have a number of  
12 responses to Motorola and Microsoft in particular,  
13 which I'd like to get to on questioning, but  
14 essentially unlike wireless microphones that are  
15 involved with professional engineering, these  
16 products are designed for consumer use throughout  
17 the area. There is absolutely no way that if an  
18 error is made, if a device breaks and it turns on  
19 to a channel, that you can ever control the  
20 interference from these devices. The FCC can't  
21 recall them. Indeed think about it. If suddenly  
22 your set gets interfered with, where can you-- how  
23 would you know where it's coming from? How could  
24 you police it? And the ability to do that at the  
25 border is problematic. So in closing, New York is

1  
2 significant and unique because of the Broadway  
3 interest, because of its sports, because it's a  
4 center of film. And I ask you to think about the  
5 numbers of viewers in your market, in your  
6 districts, that rely on free over the air  
7 television for their information, basic  
8 information and entertainment. They shouldn't be  
9 lost. I mean that digital divide needs to be  
10 closed so that they can continue to get service.  
11 Thank you.

12 CHAIRPERSON BREWER: Thank you very  
13 much. Who would like to go next? Do you want to  
14 go next? Mr. Brunner?

15 MARK BRUNNER: Good morning,  
16 Chairperson Brewer, members of the Committee. My  
17 name's Mark Brunner. I'm the Senior Director of  
18 Public and Industry Relations for Shure  
19 Incorporated, the worldwide leading manufacturer  
20 of wireless microphones. It's also nice to see  
21 some of our wired microphones used to capture  
22 today's hearing. Thank you for inviting me to  
23 participate today. The panel of experts you've  
24 assembled is impressive and I'm particularly  
25 pleased that you've taken the time to hear

1  
2 directly from the Broadway League. The League has  
3 been a thought leader at the Federal  
4 Communications Commission and in Congress on the  
5 white spaces issue, so it's certainly appropriate  
6 that you've heard from them today. The amount of  
7 wireless audio used on Broadway throughout each  
8 and every performance is dramatic and the reps  
9 here have told you in great detail about how their  
10 mics are deployed and how Broadway contributes in  
11 such a significant way to the City's cultural and  
12 economic well being. As bright as the lights of  
13 Broadway are, however, I think it's equally  
14 important for the Council to keep in mind the  
15 multitude of other wireless microphone uses in the  
16 City. To introduce these venues to you, let me  
17 drop a few names you're familiar with, Radio City  
18 Music Hall, the Ed Sullivan Theatre, Madison  
19 Square Garden, Rockefeller Center, The Javits  
20 Center, Yankee and Shea Stadiums, both old and  
21 new. The diversity of events from ball games to  
22 political conventions, from corporate seminars to  
23 news broadcasts is tied together by a common  
24 production infrastructure in which thousands of  
25 wireless microphones and not to mention in-ear

1  
2 monitors and behind the scenes intercoms are  
3 deployed on the stages, sets, streets, studios and  
4 sidelines of New York City. These major venues  
5 with huge demands for wireless audio  
6 infrastructure provide an important cultural and  
7 economic benefit for this city, the state and the  
8 entire region. These world-renowned venues,  
9 however, are just a fraction of those potentially  
10 impacted by the FCC's white spaces decision. In  
11 fact it is the smaller venues, the nightclubs,  
12 college sports broadcasts, churches, hotels and  
13 Off-Broadway and non-profit theatres who will feel  
14 an even bigger pinch from an ill-advised FCC  
15 decision, due to budget constraints and an  
16 economically challenging environment. If the new  
17 white spaces have the potential for the  
18 debilitating interference to wireless microphones  
19 that we saw throughout the FCC's recent field  
20 tests at the Majestic Theatre, tens of thousands  
21 of wireless microphones deployed on a daily basis  
22 in New York City could quickly turn from  
23 completely reliable to randomly functional. The  
24 high population density of New York already makes  
25 coordination of wireless audio extremely

1  
2 challenging. In fact, Times Square has been  
3 described by audio professionals as the most  
4 difficult spectrum environment in the world.  
5 Introducing personal wireless devices that operate  
6 in the same spectrum to the general public is, in  
7 the minds of those professionals, a formula for  
8 disaster. The City's institutions can't afford to  
9 simply trash their audio technology investments,  
10 and the FCC policy should not require them to,  
11 when there is no available substitute for these  
12 high quality professional products. The bottom  
13 line, the FCC is being pressured by white space  
14 device advocates to make their decision before  
15 President Bush leaves office and the new President  
16 appoints his own Commissioners at the FCC. We  
17 think to force an arbitrary political deadline on  
18 such an important technical decision does a  
19 disservice to the many legitimate stakeholders in  
20 this debate here in New York City and in other  
21 major news and entertainment hub markets like  
22 Chicago, Los Angeles, Las Vegas, Nashville and  
23 many others. The original primary goal of the  
24 white spaces proceeding was to deliver broadband  
25 access to underserved rural areas of the country.

1  
2 And the pro audio industry wholeheartedly supports  
3 this. But now we face a very different dynamic  
4 with much more severe consequences for our  
5 country's urban centers of commerce and culture.  
6 The FCC has proposals before it that we believe  
7 make sense and attempt to forge a reasoned  
8 solution. Simply put, we're encouraging the  
9 Commission to reserve sufficient spectrum for  
10 wireless microphone use that meets everyday needs  
11 and is scalable to accommodate large events. We  
12 also encourage further research on interference  
13 mitigation technology, some of which you've heard  
14 about today, that will inevitably be required in  
15 the future as an increasing population of wireless  
16 products is deployed throughout the nation. We do  
17 not, however, support blind faith that these  
18 technologies are ready for mass production until  
19 they are demonstrated to be viable both in the lab  
20 and in the field. Today, however, particularly  
21 for cities like New York, where the white spaces  
22 are really dark gray spaces, there needs to be  
23 clear priority for wireless microphone operation  
24 before white space devices may send out any  
25 transmission signals. We're hopeful that the

1  
2 advocates for the new devices will see the wisdom  
3 for this approach in order to move forward with  
4 innovation without moving backwards on  
5 communications, arts and culture. Last week I was  
6 re-reading some of the FCC's filings from two of  
7 the outstanding members of Congress from New York,  
8 Representatives Maloney and Nadler. And I was  
9 once again reminded that no city, no region, will  
10 feel the impact of interference from white space  
11 devices than right here in New York. The culture  
12 and economic risks are significant and real, and  
13 the entire production community employed in this  
14 city is greatly concerned about the outcome.  
15 There simply is no second chance for a live  
16 performance. Please accept my company's  
17 appreciation for inviting me to testify here  
18 before you today. It is our hope that the Council  
19 adopts the pending resolution in a New York  
20 minute. I welcome any questions.

21 CHAIRPERSON BREWER: Thank you very  
22 much. Sir, would you like to testify?

23 JAMES SMITH: Yes. I'm a citizen  
24 producer through Manhattan Neighborhood Network.  
25 I produce a program--

19  
20  
21  
22  
23  
24  
25

CHAIRPERSON BREWER: [Interposing]

Identify yourself, sir.

JAMES SMITH: Yes, my name is James Smith. I am a citizen producer at Manhattan Neighborhood Network. I produce a program called A Reader's Channel, it's a program designed to stimulate people to read more. And this issue came to me through a group for the elderly. I was excited when I bought the analog converter box, because I noticed that there were extra channels for each channel. Channel 4 has three extra channels, and the same with most of the other channels. And I saw that as a potential opportunity for public access, because public access on cable is limited because it goes only to subscribers who can afford \$100 a month. That's very expensive. And the white space issue might present us with the possibility of Internet transmission, which we have, but it is weak. It's not a strong transmission. And so I was excited. I wondered about these extra channels. How, you know, what were they about? And I did a little research and I was told that you were capable of splitting a single channel into the several

1 channels. Unfortunately this issue was not  
2 mentioned anywhere in all the promotion of DTV on  
3 television. And the different stations were using  
4 things such as weather and another station was  
5 presenting church programs, and a few were using--  
6 for infomercials, which we certainly don't need  
7 any more of. And I was excited. But there was a  
8 gentleman who was at the meeting who mentioned who  
9 was there because of white space. I asked him  
10 what was the possibility of that and he said well,  
11 it would be the Internet. It would reduce the  
12 cost for broadband, which is very significant.  
13 Because public access as we have it now isn't  
14 really public access, it's only to people who have  
15 subscriptions to cable. And the Internet at the  
16 moment is not that strong. I've wondered why the  
17 streaming hasn't been fortified lately. I suspect  
18 it's a political reason more than anything else,  
19 frankly. But if this white space could provide us  
20 with cheaper broadband access, I'm certainly for  
21 it. And I'm trying to learn more about it and  
22 that's why I came to testify.

24 CHAIRPERSON BREWER: Thank you very  
25 much and thank you for all your work at MNN. We

1  
2 certainly have a show there and we love it. I  
3 guess I would say for Mr. Donovan, just maybe you  
4 want to respond to some of the things that  
5 Motorola and Microsoft were talking about. But  
6 also, maybe you could just explain for the people  
7 who are getting educated today, the DTV transition  
8 will create more white space, but that's also got  
9 some nuances to it. So I'm just wondering if you  
10 could explain that and maybe just pick up on some  
11 of Mr. Smith's ideas about could there be more  
12 broadcasts.

13                   DAVID DONOVAN: Sure. A number of  
14 things here, because channels 52 to 69 will no  
15 longer be part of the television band, you have to  
16 take all those channels that are on those  
17 frequencies now and move them down into channels 2  
18 through 51. They have to be moved. In addition,  
19 you have a number of low power stations, and I  
20 have the full list of low power here and I won't  
21 go through it; it is quite lengthy in New York, of  
22 stations that are in New York. You also have  
23 every wireless-- the Commission has a proposal in  
24 front of it now that says every wireless  
25 microphone that currently operates on channels 52

1  
2 to 69, and there are a lot of them, they also are  
3 getting kicked out of that band and will have to  
4 move into channels 2 through 51. So, the argument  
5 that post-- with the digital transition that there  
6 will be a significant amount of room on channels 2  
7 through 51, most of that room is going to be down  
8 in between channels 2 through 4, 2 through 5 in  
9 particular. And the reason is that broadcasters  
10 are moving out of those channels because of  
11 interference with, frankly, your power grids. As  
12 I said before even a little bit of digital  
13 interference locks in; analog you never saw it,  
14 you see it in digital. So the heaviest congested  
15 area is going to be in between channels 20 and 51.  
16 And the white space proponents want to focus their  
17 attention for the most part on channels 21 through  
18 51, which is extremely congested. The second  
19 piece, in dealing with the multi-casting; with  
20 digital we are able to subdivide our existing  
21 allocation. We get six megahertz and you're able  
22 to subdivide that and to develop new uses with it.  
23 Consumers that are getting the digital over the  
24 air converter box that the government is pushing  
25 will now, for the first time, be able to access

1  
2 those channels on their old analog television  
3 sets. That is, and I agree with you, we have not  
4 publicized enough, that is a significant benefit  
5 to the American consumer. The problem is that is  
6 a digital tuner in that box and that tuner is  
7 susceptible to the interference caused by the  
8 white space devices. So the good news is you'll  
9 get more channels; the bad news is, is as you go  
10 down the road, they are more susceptible to  
11 interference and now you're going to have  
12 problems. To respond to some of the-- I mean my  
13 wife tells me so that I can fill a room forever,  
14 so please.

15 CHAIRPERSON BREWER: Don't do that.

16 DAVID DONOVAN: Just a couple of  
17 things. I think one of the key things here is  
18 that the whole goal of reducing broadband costs,  
19 which is an important part of this debate, none of  
20 the proponents here are guaranteeing in any way,  
21 shape or fashion that you're going to get free  
22 broadband. There is only one video source in  
23 America today that you get for free, and that is  
24 for the price of an antenna and a \$40 converter  
25 box you get over the air television broadcast. So

1  
2 as you're working out the economic equities, I ask  
3 you to really begin to focus on that. Now my  
4 friends from Motorola talk about Geo Location.  
5 And Geo Location is an interesting thing to look  
6 at. Of course it really hasn't been thoroughly  
7 tested at the FCC. There were some tests in  
8 Maryland and they were done by manually inputting  
9 data. But if you go with a Geo Location system  
10 and you also want to protect wireless microphones,  
11 that database is going to have to include  
12 obviously your TV stations, your low power TV  
13 stations, all your wireless microphone users,  
14 schools that use wireless microphones, City  
15 Council Chambers to the extent you use wireless  
16 microphones, every church and synagogue and every  
17 theatre. You will also have to make sure you deal  
18 with cable head ends and satellite uplink  
19 facilities. That can be done; it isn't easy. The  
20 question though is as you begin to protect every  
21 school, is there going to be sufficient room to  
22 actually do the broadband services that are so  
23 advertised here in urban markets. Where I think  
24 you're really running with this in urban areas,  
25 which is why some of these folks are really into

1  
2 this, is you're talking about smaller systems, in-  
3 home wireless networking, game controllers, those  
4 types of devices. And candidly, there's other  
5 spectrum to use that. The arguments that you talk  
6 about-- the spectrum having great propagation  
7 characteristics. In urban areas it also means it  
8 has greater interference characteristics. Now, on  
9 beacons, just so you understand on beacons, one,  
10 they have never been tested by the FCC; two, if a  
11 device has trouble sensing the existence of a  
12 broadcast signal, which is in a megawatt range, I  
13 don't know how well it's going to sense a 250  
14 milliwatt beacon; three, if it is shouting as  
15 loudly as my friend from Microsoft says, that too  
16 will cause interference; four, it is very  
17 inefficient. If I, God forbid, have another event  
18 in this city or a major event and all the news  
19 trucks go together, and this is what I'm concerned  
20 with is local news, I now have to start putting up  
21 beacons in a large chunk of the spectrum that I  
22 could be used for news reporting, I am now going  
23 to have to use for centrally de-jamming beacons.  
24 It is very problematic. [Pause] I think one of  
25 the things you need to remember is--and it goes to

1  
2 the fundamental question--does the FCC have enough  
3 data to make a decision. [Pause] Right now,  
4 after four years of working on this, no sensing  
5 device has worked--they have failed. Indeed the  
6 Microsoft device, I'm happy he's for a win-win  
7 situation, but he hasn't produced a device that  
8 works even in a lab. The closest you get is the  
9 Philip's device which registers every channel as  
10 occupied, it's sort of like taking your  
11 grandmother's hearing aid and turning it up real  
12 loudly. You can't live on marketed device that  
13 does that. So what you're asking the commission  
14 to do is to guess [pause] and indeed to go forward  
15 with the technology that has proven that it does  
16 not work, if it's sensing, with geolocation, a  
17 system that has just marginally been tested and I  
18 submit if you go down that road, when the  
19 government goes to certify these things, all  
20 certification says that this device was built to  
21 the rule. If you get the rule wrong, that  
22 certification almost becomes meaningless.

23 CHAIRPERSON BREWER: Thank you very  
24 much [Off mic]

25 COUNCIL MEMBER JAMES: Could you

1  
2 just talk a little bit about the tests that were  
3 performed and the false positives?

4 DAVID DONOVAN: Sure.

5 COUNCIL MEMBER JAMES: Could you  
6 just go over that one more time?

7 DAVID DONOVAN: Yes. One of the  
8 issues, and it is in my testimony, it is correct  
9 the FCC has not produced any, produced its results  
10 on this. What you have on my testimony, we had an  
11 observer who was a former head of the FCC's  
12 engineering arm looking at all these tests and  
13 here's how it goes: The key thing about sensing is  
14 you have to be able to differentiate between a  
15 signal that is being used and when a signal that  
16 isn't being used. One of the problems with the  
17 Philip's device is that no matter where it was, it  
18 said all signals are being used. That even  
19 occurred during a lab test inside an anechoic  
20 chamber--this is a giant spectrum meat locker  
21 where no signals come in or come out. [Pause] It  
22 is clear, and I think it was admitted up here, is  
23 that what you're doing is if you crank up the  
24 sensing so much, it will always say [pause] that  
25 its spectrum is being used, that channels are

1  
2 being occupied. Now their conclusion is, hey,  
3 don't worry, I'll never interfere with you  
4 [pause], but the real question for policy makers,  
5 do you have a device that works? In other words,  
6 can you put an attenuated, or can you ratchet down  
7 the sensitivity so that it actually does  
8 differentiate because you and I both know that  
9 they could never sell a device in the marketplace  
10 that essentially never turns on or does what it's  
11 supposed to do. They have to ratchet it back and  
12 they've been unable to do so.

13 COUNCIL MEMBER JAMES: And last  
14 question to the gentleman from Shure,  
15 Incorporated, you mentioned Congress member  
16 Maloney and Nadler, has any other member of  
17 congress and the New York delegation, do they  
18 have--have they come out with an opinion, i.e.,  
19 Chairman Charlie Rangel or any other members of  
20 the caucus, the Hispanic Caucus, the Black Caucus?  
21 Have they taken a position on this?

22 DAVID DONOVAN: Yes.

23 COUNCIL MEMBER JAMES: They have.  
24 What's--

25 DAVID DONOVAN: Yes, you have over

80 letters from members of congress to the FCC. I believe Congressman Engel has sent a letter down. I'm not sure--I need to double-check my records as to Congressman Fossella. In addition, Congressman Gonzalez [pause] one of the--

COUNCIL MEMBER JAMES:

[Interposing] The [off mic]

DAVID DONOVAN: I'm sorry?

COUNCIL MEMBER JAMES:

Congresswoman Velasquez from Brooklyn, has she [crosstalk]--

DAVID DONOVAN: [Interposing] Not to--I'll check my files, I don't believe so.

COUNCIL MEMBER JAMES: Could you forward a copy of that letter to the committee?

DAVID DONOVAN: Absolutely.

COUNCIL MEMBER JAMES: Thank you.

DAVID DONOVAN: And Congressman Gonzalez, who is a leading member of the Hispanic Caucus as well.

[Off mic]

DAVID DONOVAN: No, no, no.

[Pause]

CHAIRPERSON BREWER: Given this

1  
2 discussion today, one of the questions I have is,  
3 do you see that there is a time when the  
4 television and the opportunity for the devices to  
5 work and the wireless microphones to work in some  
6 way, shape, or form? Do you see that--how do we  
7 get to this place?

8 DAVID DONOVAN: To be blunt, you  
9 could have had rural broadband in TV white spaces  
10 in this country several years ago. Canada's doing  
11 it, they're using a licensing approach. We've  
12 never opposed this. The problem is when you get  
13 into, into urban areas where spectrum is congested  
14 and you have high-density living, your problems  
15 increase. I do not believe at this point, given  
16 the architecture of broadcasting and the way  
17 digital signals work where you don't have a signal  
18 over here and you move five feet and you get a  
19 perfect signal, that sensing is going to be an  
20 effective tool to avoiding interference.  
21 Geolocation, assuming you get the database done  
22 right and you get the rules done right, is  
23 something that's worth exploring--I'm not so--I  
24 just don't think soup [phonetic] yet.

25 CHAIRPERSON BREWER: Thank you all

1  
2 very much, thank you very much. A great helpful  
3 panel and we look forward to more discussions.

4 DAVID DONOVAN: Thank you.

5 CHAIRPERSON BREWER: Just so  
6 everyone knows, we're not going to be voting on  
7 the resolution today and so we will be voting on  
8 it in the near future, we will let people know,  
9 but it will not be today. The next panel is  
10 Joshua Breitbart from the People's Production  
11 House, Dana Spiegel for NYCwireless, Tim Karr from  
12 Free Press, and Chris Keeley from Common Cause.  
13 [Pause] Whomever would like to go first. [Pause]  
14 What's with the water, Dana? Go ahead, whoever  
15 would like to first. Josh.

16 [Pause]

17 JOSHUA BREITBART: Good morning.  
18 Thank you to the Chair, the other members of the  
19 Committee and Council and staff who have made this  
20 hearing possible, it's a very important issue, I'm  
21 glad we're here today. My name is Joshua  
22 Breitbart, I'm the Policy Director of People's  
23 Production House. People's Production House  
24 provides young people, immigrants, and low-wage  
25 workers with a comprehensive education for the

1  
2 information age, combining media production, media  
3 literacy, and media policy. We work in public  
4 schools and with community organizations in all  
5 five boroughs. I should also say I'm a Brooklyn  
6 native and I watch TV over my rabbit ears. Short  
7 of paying for everyone's internet bill, the  
8 certification of low-power white space devices,  
9 WSDs, is the single greatest step that we could  
10 take towards closing the digital divide in this  
11 country and it will not cost the taxpayers a dime.  
12 It is distressing to me and all of my  
13 organization's members that you would oppose this  
14 measure as the draft resolution suggests. The  
15 current draft resolution does not even mention the  
16 digital divide, although I do appreciate that some  
17 of these issues were raised in the opening  
18 PowerPoint presentation. This resolution, as  
19 currently drafted to discourage certification,  
20 would be harmful to the work of People's  
21 Production House and to our city. I say this as  
22 someone who has been very supportive of this  
23 committee in the past. You have done so much to  
24 bridge the digital divide, use technology to  
25 improve government, strengthen New Yorkers'

1  
2 experience of technology, and boost our local  
3 economy, which is, of course, increasingly reliant  
4 on technology and telecommunications. However,  
5 this draft resolution runs counter to all of those  
6 goals. And I should say that I'm just reading  
7 briefly through the comments and my written  
8 comments are more expensive-extensive. It is sad  
9 to see this proposed resolution, which is so  
10 filled with fear and confusion. However, just now  
11 listening to the representative from the major  
12 broadcasters, you know, we just see that that--  
13 that the main that they have on their side is fear  
14 and in contrast, engineering, the law, the  
15 economic health of our city, and the moral  
16 imperative of closing the digital divide are all  
17 on our side giving us hope for the success of  
18 device-certified access to the white spaces. The  
19 proposed resolution is simply bad policy. My  
20 written comments contain a full analysis of the  
21 resolution, including its factual errors,  
22 omissions, and misrepresentations, of which there  
23 are many. Members of this committee should ask  
24 for references to back up the claims in the  
25 resolution before you go on the record supporting

1  
2 them. Since this is a technical issue that can be  
3 hard to engage the public on, People's Production  
4 House has produced two educational videos to  
5 explain what white spaces are and why they are  
6 important. One is an animated history of our  
7 airwaves, it is 3 1/2 minutes long, the other is a  
8 two minute examination of the problems immigrants  
9 face using prepaid calling cards to call friends  
10 and family in other countries, which white space  
11 devices would help solve. Abdulai Bah, who is the  
12 host of that video, wanted to be here today, but  
13 10 a.m. on a Monday is a challenging time for  
14 those of us who aren't, like myself, professional  
15 advocates. I have included those movies on a DVD  
16 with my written comments, please watch them and  
17 show them to your constituents. They are also  
18 available on the Internet at our website, it's  
19 [www.speakandlisten.net](http://www.speakandlisten.net). However, to make this  
20 dense issue even more confusing, the committee  
21 Chair and the Council have both assured me  
22 personally that this resolution, while asking for  
23 the FCC to take its time in making a decision,  
24 actually supports white space devices, although  
25 cautiously. But I don't see that the resolution

1  
2 says that. Why can't the resolution say nearly  
3 the same thing as it now does, but be phrased  
4 positively--as in the Council of the city of New  
5 York urges the Federal Communications Commission  
6 to implement proposed regulatory amendments that  
7 would allow portable and fixed devices to operate  
8 on the white spaces of the radio spectrum without  
9 causing harmful interference to television  
10 broadcasters and wireless microphones? It's  
11 nearly the same message, but hopeful instead of  
12 fearful. We should be excited about what this  
13 technology can do for our city, not afraid. Along  
14 with my written comments, I'm also including a  
15 model resolution which is much more positive. If  
16 you want New York City to be considered a leader  
17 in the nation on issues of technology, a visionary  
18 for the 21st century, I implore you to consider  
19 this alternate resolution. This model resolution  
20 is also available on the website and I look  
21 forward to receiving feedback from members of the  
22 Broadway League and the non-profit theater  
23 community. However, the current draft resolution  
24 sends a message that this city is closed for  
25 business in the tech sector. It tells advocates

1  
2 like myself and others here today that if we want  
3 to continue our work of trying to bridge the  
4 digital divide, we must do it with one wireless  
5 hand tied behind our back. To repeat, the current  
6 draft resolution does not even mention the digital  
7 divide and even if you decide against our position  
8 on this issue, I don't see how you can ignore the  
9 76% of low-income New Yorkers who lack a high-  
10 speed Internet connection. And, again, I know  
11 that that is not the general position of this  
12 committee, based on its past work, but this  
13 resolution just runs counter to those past  
14 positions. And Council Member James asked before  
15 about how exactly this would address the digital  
16 divide and I'd be happy to answer that in comments  
17 and there's some of that in my written comments.  
18 People's Production House, like all other WSD  
19 advocates, wants the FCC to establish rules for  
20 certifying devices that can peacefully coexist on  
21 the vacant TV channels. The FCC's tests have  
22 shown that this is feasible. Everyone agrees that  
23 if the devices can't follow the rules, they  
24 shouldn't be certified. That's simple enough, but  
25 if you want to pass a resolution to that effect, I

1  
2 don't understand why it needs to be framed so  
3 negatively. Why not urge the FCC to adopt  
4 measures to protect currently unauthorized users  
5 of wireless microphone systems while also closing  
6 the digital divide and boosting our economy? The  
7 worst part of the current draft resolution is that  
8 it suggests that we have to choose between  
9 wireless microphones and new devices to close the  
10 digital divide when the new technology allows us  
11 to have both. If some groups wanted to sacrifice  
12 low-income New Yorkers to preserve Broadway, I  
13 would oppose them, but I would understand their  
14 position. But to sacrifice low-income New Yorkers  
15 for no reason at all, as this resolution does, is  
16 simply madness. I urge you to vote against this  
17 resolution as drafted.

18 [Pause]

19 CHAIRPERSON BREWER: Who wants to  
20 go next? Dana?

21 [Off mic]

22 [Pause]

23 DANA SPIEGEL: Thank you for  
24 inviting me. My name is Dana Spiegel, I'm the  
25 Executive Director of NYCwireless, a non-profit

1 here in New York City that uses WiFi technology,  
2 which is--which uses unlicensed spectrum to  
3 provide free WiFi Internet access into a number of  
4 public spaces. I'd like to first very briefly  
5 address a couple of points that were made by  
6 previous panelists here and hopefully ratchet down  
7 the hyperbole a bit. I come to you as a  
8 technologist first and foremost, a geek, if you  
9 will. I'm not a, I'm not a government liaison or  
10 any of those other types of people that you're  
11 listening to today, I make my money and do my job  
12 and volunteer building technology first and  
13 foremost not supporting the people that build  
14 technology. First of all, there was a comment  
15 that was made on a previous panel about the  
16 inability for there being--for there to be space  
17 to operate. I'd like to just point out as per--a  
18 an example, I've got a number of wireless devices  
19 in my home today. Some use Bluetooth, like this  
20 headset right here, others use WiFi like this,  
21 like this phone right here and that talks to my  
22 Bluetooth headset and at home I've got a few  
23 different WiFi networks. I've also got a number  
24 of different WiFi networks from my neighbors and  
25

1  
2 I've got at least one other device in my home that  
3 broadcasts music to my stereo from a central  
4 location, to actually to a number of stereos  
5 that's not, that's not WiFi based at all, but in  
6 fact uses a different type of mesh technology.  
7 But still in that tiny little sliver of 2.4 GHz  
8 that's made available to us by the FCC for  
9 unlicensed usage, we have--I have quite a number  
10 of devices using otherwise incompatible wireless  
11 broadcast technology that all operate seamlessly  
12 and without interference. And in fact all of my  
13 neighbors, neither do they experience any the  
14 interference from the devices that are operating  
15 inside of my apartment. This is something that  
16 has been brought out as testimony that you cannot  
17 have wireless devices that operate together, that  
18 when you have one wireless technology using a  
19 slice of the spectrum that you can't have other  
20 technologies also using those slices of spectrum  
21 and that's just patently false, because clearly  
22 you can and we all experience this daily. There  
23 was a question about, or there was a comment about  
24 the inability to coordinate frequency and I would  
25 like to point out that using WiFi technology, just

1  
2 about everyone that installs a home wireless  
3 router in their apartments or their houses already  
4 does exactly this. They are able to coordinate  
5 the usage of the 2.4 GHz frequencies with just a  
6 click of a button because that's just how easy  
7 software is to operate. And so my father, who is  
8 a lawyer by trade and not a technologist, can  
9 easily make his WiFi--install and make his WiFi  
10 device operate, even though there are other WiFi  
11 devices using, using channels that are operating  
12 in the same space that he's--that he wants to  
13 install his WiFi or router for. There was a third  
14 comment about this being not an either or  
15 situation and I patently and firmly believe this.  
16 In fact, what you're going to wind up seeing  
17 technologically speaking is a very slow rollout of  
18 wireless technologies, such that come the DTV  
19 transition when the white spaces are hopefully  
20 going to become available for use by wireless  
21 technologies, you're going to see a slow rollout.  
22 Just like we saw with WiFi, it took years upon  
23 years, in fact, WiFi was first invented, precursor  
24 to WiFi was invented in 1991, and we didn't build  
25 our first WiFi hotspot until 2000. There was

1  
2 another comment made by the Broadway Coalition--I  
3 forget by whom--talking about how they spend weeks  
4 upon weeks coordinating frequency usage just to  
5 launch a show and I sympathize tremendously with  
6 that painful, painful process, but the types of  
7 technologies that we're talking about introducing  
8 into the devices that make use of WiFi--sorry,  
9 white space devices are going to be not just far  
10 more efficient in their usage of the spectrum, but  
11 they will automatically take care of a lot of that  
12 coordination. So what would otherwise take three  
13 plus weeks to use and 40 to 70 channels of signal  
14 to make use of for just plain audio, will in the  
15 future instead be able to make the same  
16 functionality available on only a couple of  
17 channels of usage all automatically configured by  
18 the software and the hardware to interoperate  
19 within a matter of hours if not less instead of  
20 weeks on end. So very briefly, I'd like to just  
21 present a little bit about the history of WiFi and  
22 draw the few parallels to what, what we hope to  
23 see with white spaces--and again I come to you not  
24 to talk about the, the comments that Shure and  
25 other wireless manufacturers have made, other

1  
2 people on this panel are going to talk a lot more  
3 about the technicalities of that and I'm, and I'm  
4 not going to talk to you about some of the  
5 specifics regarding white space devices either.  
6 But I wish to solely speak about the value of such  
7 white space devices for all of New York City and  
8 draw some parallels for the WiFi and its history,  
9 and I believe that there are enough similarities  
10 that we can actually draw some realistic  
11 conclusions about what might actually happen.  
12 WiFi uses radio frequency spectrum covered under  
13 FCC's Part 15 which allows companies to  
14 manufacture and sell certified devices that  
15 operate in the 2.4 GHz unlicensed frequency range,  
16 which--and allows anyone to purchase these devices  
17 and operate them without applying for an official  
18 FCC broadcast license. If you use WiFi in your  
19 house, office or park, you are using a Part 15  
20 device. Same goes for Bluetooth headsets that you  
21 use with your mobile phones, baby monitors, garage  
22 door openers, and some cordless phones--all of  
23 which make use of this tiny, tiny little sliver of  
24 spectrum and operate perfectly fine and coordinate  
25 their interaction without much interference. The

precursor to 802.11 technology was invented in '91 and since then has enjoyed tremendous success-- you'd be hard-pressed to find a computer user today who hasn't used WiFi at some point. But it was never imagined as such ubiquitous or widely used technology. It was always originally intended that WiFi devices would be used in large office buildings only and consumer use was never even considered. In 2000, in New York and a few other cities like Boston and Seattle, technologists started using the WiFi devices to do the unimaginable--share the Internet with their neighbors. NYCwireless was founded in 2001 with a pioneering purpose of using this technology to broadcast Internet access to local neighborhoods. One of the first public hotspots in the world was in our own Tompkins Square Park. Back then devices were neither easy to use nor cheap to purchase for consumers. If you had a laptop, you could buy a WiFi card and access point for a few hundred dollars, but if you went to Tompkins Square Park or Bryant Park you could do something that no one else in the world could do--sit under a tree and use the Internet. Since 2000, New York

1  
2 City has seen dozens of Parks lit up by  
3 NYCwireless and others and each year more parks  
4 and public spaces are brought online--and actually  
5 we just installed our second WiFi hotspot in  
6 Clinton Hill in Brooklyn. New York City was host  
7 to the first-ever wireless arts festival called  
8 Spectropolis in 2003 and 2004 held right here in  
9 City Hall Park. NYCwireless and others have lit  
10 up dozens of affordable housing residences and  
11 providing residents the ability to get online and  
12 have a critically important lifeline. None of  
13 these achievements would have been possible  
14 without the FCC enabling free unlicensed use of  
15 the 2.4 GHz spectrum range--and I might also add  
16 that every single device that makes use of--every  
17 single WiFi device is 100% certified by the FCC  
18 and tested completely for proper operation  
19 according to the 2.4 GHz usage rules. But even  
20 more impresses--impressive than these achievements  
21 has been the explosion of WiFi usage throughout  
22 New York City. Just about every business, both  
23 big and small, makes use of WiFi--cafés,  
24 restaurants, bars, and coffee shops offer WiFi to  
25 their customers and a significant percentage of

1  
2 the over 8 million residents of this city use WiFi  
3 in their homes. And I bring this up specifically  
4 because there have been comments about the number  
5 of people that benefit from the use of existing  
6 wireless microphone devices and the huge  
7 industries that are supported by their use, and  
8 that's a very, very important component of the  
9 city, but even more important are the hundreds,  
10 thousands actually of businesses that make use of  
11 WiFi technology and who would only see benefits  
12 from the, from the use of white space devices as  
13 well. With all these people using WiFi and  
14 Bluetooth, you don't often hear about interference  
15 issues, just about everyone makes use of WiFi in  
16 their homes and businesses without issue.

17 Bluetooth headsets work wherever you walk, baby  
18 monitors and cordless phones, devices that use the  
19 same tiny sliver 2.4 GHz spectrum work just fine  
20 too. With all of its success, it's actually  
21 surprising that WiFi is in part utterly unlike the  
22 types of devices that the FCC is considering for  
23 use in white space frequencies and the biggest  
24 difference is that the proposed FCC rules for  
25 white space devices ensure that they will not

1  
2 interfere with existing spectrum users and that  
3 devices will contain technology to move around the  
4 white space spectrum automatically to ensure that  
5 they never do interfere. And this is very  
6 different from WiFi where the operator--meaning  
7 you or me in our home--have to select the  
8 frequency for operation and then tune the device  
9 ourselves and then if there is interference, it's  
10 incumbent upon us, the operator, to change this  
11 and so, in fact, the regime that the FCC is  
12 talking about implementing right now is very  
13 different in that it's far more restrictive in  
14 terms of its operation than WiFi is today. In  
15 discussing this history of WiFi and highlighting  
16 its achievements, I hope to paint a picture for  
17 the council about what space devices may mean for  
18 New York City. Such devices have the possibility  
19 of enabling larger scale Internet broadcast,  
20 providing inexpensive or free access to whole  
21 neighborhoods from the central anchor of a park.  
22 More buildings will be able to be retrofitted with  
23 Internet access--a current challenge for a number  
24 of old NYCHA buildings, for example. Schools and  
25 libraries will become Internet hubs, and in fact

1  
2 some of them already are, most libraries in New  
3 York City provide free WiFi access to visitors.  
4 In short, this--the amazing things that we've done  
5 with WiFi will be amplified with the availability  
6 of white space devices. The FCC already has  
7 proposed white space device rules in place that  
8 ensure non-interference. Indeed New York City and  
9 Broadway, who make--who actually make use of WiFi  
10 in their theaters to provide Internet access to  
11 stage and production staff, stand to benefit  
12 enormously from white space devices--even while  
13 continuing to use their existing technology.  
14 Imagine if, instead of just using wireless  
15 microphones for audio, we could instead have video  
16 performances that could be broadcast across entire  
17 neighborhoods and those entire neighborhoods could  
18 be--could participate in such events. This is a  
19 promise of the white space devices that are  
20 currently being considered for the FCC--in front  
21 of the FCC today. Thank you.

22 CHAIRPERSON BREWER: Thank you.

23 Who's next?

24 [Pause]

25 TIMOTHY KARR: I'll go next. Hi,

1  
2 I'm Timothy Karr, I'm the Campaign Director of  
3 Free Press. Free Press is a national media reform  
4 organization, we have nearly 500,000 members of,  
5 of those there are 17,000 members who lives in New  
6 York City and I'm happy to report that that many  
7 of them are here today. As you may have guessed  
8 by now white spaces is a political issue, but it  
9 really boils down--

10 CHAIRPERSON BREWER: Really?

11 TIMOTHY KARR: Yes. But it really  
12 boils down to this, white spaces is an issue that  
13 pits those who have spectrum access and want to  
14 keep it for themselves against those who don't and  
15 want spectrum to be used to serve other purposes  
16 as well. Such purposes such as high-speed  
17 Internet access, especially for communities that  
18 have been bypassed by the incumbents or who simply  
19 can't afford access. In the middle of it all is  
20 developing technology, which despite what you have  
21 heard from some of the haves in the room today,  
22 can and will meet acceptable and certifiable  
23 standards of noninterference. The FCC is sorting  
24 that out at the moment, as it should, but it's  
25 important to understand that politics should not

stand in the way of technology, especially technology that could bring vast benefits to so many people. So let's look at the opportunity.

[Pause] Free Press analyzed the five boroughs of New York City and we looked at the available spectrum in this, in this band. We found that after the February 2009 digital transition, there will be 10 vacant channels in New York City for low-power broadband use--that means 20% of the entire TV band will be laying idle. This is amazing given the usual overcrowding that occurs in heavily populated areas. By contrast, for example, in Juneau, Alaska they have 74% of similar spectrum available, still 20% is a considerable amount. But more important, if we were to limit the spectrum to licensed use, there be no white spaces for use in New York City--none at all. This is because unlicensed use permits low-power, small devices such as those being created by engineers at Philips and Motorola.

[Pause] This is--license does not--this is only to underscore an important point, licensing in New York City means no new broadband providers.

Unlicensing this incredible new technology is one

1  
2 of the last best hopes we have to deliver vital  
3 broadband services to New Yorkers who need it  
4 most. It's important that the city council not  
5 stand in the way of this important innovation for  
6 your fellow citizens. As it is written, this  
7 resolution is not only unnecessary but also is  
8 possibly a step in the wrong direction. We urge  
9 you to ask the FCC to decide in the public's best  
10 interest and that's to open white spaces for  
11 everyone. Thank you.

12 CHAIRPERSON BREWER: Thank you.

13 [Pause]

14 CHRIS KEELEY: Good afternoon. My  
15 name is Chris Keeley and I'm Associate Director of  
16 Common Cause/New York. Common Cause/New York is a  
17 nonpartisan, nonprofit citizens' lobby and a  
18 leading force in the battle for honest and  
19 accountable government. In New York State, we  
20 have 18,000 members statewide, many of them here  
21 in the city. Right now we're working on several  
22 fronts, including working to increase the  
23 diversity of voices and ownership in media, to  
24 make media more responsive to the needs of  
25 citizens in a democracy, and to protect the

1 editorial independence of public broadcasting.

2 For decades, we have fought to increase access to  
3 government and government transparency. The

4 proposal before us today offers a valuable

5 opportunity to consider major development in

6 telecommunications, namely the burgeoning

7 availability of white spaces. Common Cause

8 believes that white spaces hold great potential

9 for increased democratic participation and greater

10 access to government. The Federal Communications

11 Commission proposes that these spaces remain

12 available for public use, Common Cause, here in

13 New York and nationally, supports this proposal.

14 In recent years, the Internet has provided far

15 greater access by citizens to their government.

16 Whether it is through the posting of legislation

17 or regulatory proposals online, web streaming of

18 committee meetings, or the availability of

19 government forms for download, the Internet has

20 brought access to the government decision-making

21 process and its services right to the fingertips

22 of citizens with an Internet connection. White

23 spaces have the potential to unlock a wave of

24 technological innovation that bring more citizens  
25

1  
2 high-speed Internet access. Engineers, designers,  
3 and developers would have great incentive to  
4 develop new products, thereby facilitating a  
5 drastic increase in Internet connectivity, both  
6 here in New York City and throughout the state.  
7 Instead of having locally installed broadband  
8 access or limited strength municipal wireless  
9 networks, the powerful white space frequencies  
10 would unleash the Internet connectivity at far  
11 greater speeds and easily surmount many physical  
12 and economic barriers. Common Cause expects that  
13 continued technological innovation will bring more  
14 citizens and non-citizens into the technological  
15 age and help to bridge the technological gap.  
16 Many agencies here in New York State are already  
17 harnessing the power of the Internet through web-  
18 casting and posting of agendas online. With broad  
19 access--with broader access and faster speeds,  
20 however, the white spaces would provide the  
21 concerned citizens throughout the state would  
22 bring them right into the decision-making process,  
23 regardless of economic, physical, or geographic  
24 barriers. We expect to be at the forefront in New  
25 York City and state in the fight for additional

1  
2 government disclosures being provided online, such  
3 as advance notice of public meetings and the web  
4 streaming. Freeing the white spaces would broaden  
5 any of these benefits by leaps and bounds.

6 Unleashing the white space is good for democratic  
7 process in New York and good for the citizens of  
8 New York. In recent years, New York City, the  
9 members of this committee, and its Chair, in  
10 particular, have drafted and supported forward-  
11 thinking proposals to bring the people of New York  
12 into the legislative process and decision-making  
13 process by harnessing the power of the Internet.  
14 City agency information is made available for the  
15 public to review and that is largely a credit to  
16 the members of this committee. The FCC's proposal  
17 would give the valuable efforts of this committee  
18 and Council a powerful shot in the arm by allowing  
19 this additional information to be harnessed by  
20 countless additional Internet users. Common Cause  
21 strongly supports New York's cultural institutions  
22 and members of its entertainment industry. We  
23 understand the concerns cited in Resolution 1613  
24 regarding this industry. We, like the sponsors of  
25 this resolution, do not believe that the twin

1  
2 goals of protecting New York's entertainment  
3 industry and freeing the white spaces are  
4 incompatible. However, we are concerned that this  
5 resolution in its current form will encourage  
6 those who simply oppose opening up the white  
7 spaces to broader public use. We believe that the  
8 Council is in a unique position to urge the FCC to  
9 take the necessary regulatory steps to ensure that  
10 both the broader public interest and the concerns  
11 of the entertainment profession in New York City  
12 are served by the FCC's proposed regulation. We  
13 urge the committee to revise Resolution 1613 to  
14 more strongly support the underlying goal of  
15 unleashing the power of the white spaces and  
16 facilitating broader access to our city, state,  
17 and federal government. If there exist  
18 technological fixes to the problems the resolution  
19 raises, which judging by today's discussion it  
20 seems is certainly the case, we urge the Council's  
21 modified resolution to include specific reference  
22 to some of those, to some of those fixes so that  
23 there is no gray area. We know that there are  
24 technological ways around this, we know that this  
25 is not--that these twin goals are not incompatible

1  
2 and we hope that in a revised resolution we can  
3 make specific reference to those sorts of  
4 technological fixes. Thank you once again for  
5 this opportunity to testify here today and I look  
6 forward to working with the Council on this and  
7 other issues in the future.

8 CHAIRPERSON BREWER: Thank you very  
9 much. All of you have contributed a great deal to  
10 the work of this committee and I appreciate it and  
11 certainly our goal is what you talk about. I just  
12 think that what we're up against is a unique  
13 situation in terms of the Broadway and I think  
14 that certainly, Common Cause, you outline some of  
15 them. But my question is one of the concerns is,  
16 do you believe it is possible with current  
17 technology for all of these uses to exist at the  
18 same time? I know you say yes but in--nobody has  
19 what you have in your home in terms of all the  
20 devices. But those of us who have some portion of  
21 them, multiply that times much more and will  
22 Broadway still--let's just focus on the Broadway  
23 issue, because that's what the resolution is most  
24 concerned about. How do you think we would feel  
25 if just one Broadway show had interruption. It's

1  
2 one I don't really care what I have in terms of  
3 interruption at my home, but I care very much  
4 about what goes on on Broadway. And so I just--I  
5 want people to understand, we all want what you  
6 want, but we do not want any interruption in our  
7 most--our really our--maybe only draw to New York  
8 City in 2008.

9 JOSHUA BREITBART: So, I mean, I  
10 have a 9-year-old sister who loves Broadway  
11 musicals--

12 CHAIRPERSON BREWER: We all do.

13 JOSHUA BREITBART: --if I, if I had  
14 to go, you know, have Roshashana [phonetic] dinner  
15 with her tonight and tell her that what I did at  
16 work today was something that would harm that, I  
17 wouldn't build to look her in the eye. There's no  
18 way that People's Production House would advocate  
19 for any technology which would disrupt our fellow  
20 cultural institutions in this city. So I can tell  
21 you that I am 100% confident in the engineers at  
22 the FCC and the Federal Communications Commission  
23 that they will find a way--or that they could find  
24 a way to--or that they would not let certified  
25 devices that would cause interference. I think

1  
2 that the part of the problem right now is that the  
3 Broadway users, as they [pause] when they were at  
4 this panel before, said that they are currently  
5 unauthorized and I think that the FCC needs to  
6 address that problem as well as finding a way to  
7 open up the spectrum. And, as I believe I sent to  
8 some of the members of this committee, the Public  
9 Interest Spectrum Coalition has submitted a filing  
10 with the FCC that proposes what I think is an  
11 excellent solution. To the extent, just speaking  
12 for myself and my organization, to the extent  
13 that, you know, beaconing technology or anything  
14 along those lines requires any sort of capital  
15 outlay to solve that problem, I think that that--I  
16 think the people responsible for that capital  
17 outlay should be the wireless microphone  
18 manufacturers who have used deceptive advertising  
19 over the past few decades to get these  
20 unauthorized users to purchase their products.  
21 So--and I--and that's something, as I say in my  
22 testimony, that, you know, I've sent information  
23 to staff at the state attorney general to look at  
24 because I think that they've caused part of this  
25 problem and now what they want is regulatory

1 relief, not any sort of accountability.

2 [Pause]

3 DANA SPIEGEL: So I want to thank  
4 you, Council Member Brewer for asking that  
5 question because I think it is really important  
6 for us to sort of rein in our viewpoint and be  
7 very specific about the sorts of things that we're  
8 talking about here. I obviously haven't used  
9 white space devices first-hand because they're not  
10 yet available, but I do trust the technologists  
11 that both work at the FCC and work at a number of  
12 wireless equipment manufacturers, including  
13 Motorola and Microsoft even though they don't  
14 technically manufacture a whole lot of hardware,  
15 they're mostly known as a software company. I  
16 would point out that there are a couple of things  
17 that we should be considering when you do ask that  
18 question. First of all, the types of uses that we  
19 see for existing audio--wireless microphones are  
20 very limited in their scope and space size. So  
21 their--Times Square is obviously a huge headache  
22 in terms of radio spectrum usage, but you step  
23 outside of Times Square and those same frequencies  
24 are not nearly congested in the same way. So what  
25

1  
2 we're really talking about here are highly  
3 constrains relatively small, though important,  
4 parts of the city that have the potential to have  
5 some sort of concern about any legislation that  
6 the FCC might pass or rules that the FCC might  
7 pass. Same thing goes for places like Madison  
8 Square Garden, where such broadcasts are very well  
9 contained within the arena itself. We're not, you  
10 know, you can't receive a Madison Square Garden  
11 audio broadcast from their Shure microphones all  
12 the way down in the bottom of Penn Station--and  
13 maybe you can in Penn Station, but you certainly  
14 can't receive it across town in Grand Central  
15 Station. Same thing is true for Shea Stadium and  
16 Yankee Stadium and the new stadiums that are being  
17 built, you know, you'd be hard-pressed to receive  
18 much of the broadcast that they currently use  
19 along the highways that pass nearby them or  
20 potentially even the subway that passes by Yankee-  
21 -to Yankee stadiums. And so when you talk about  
22 these things the--if you can't receive the signal,  
23 then a similar, then a similar broadcast from  
24 where you can't receive the signal--if I just did,  
25 you know, if I broadcast in exactly the same way

1  
2 back to those people that were using that  
3 frequency, the same would be true for them. They  
4 wouldn't really be able to hear, much less have  
5 interference from the signals that I was  
6 broadcasting. And so if we're talking about  
7 relatively low power usage, which is what the  
8 Broadway folks on Broadway and off-Broadway use  
9 and the folks at all the other sporting events and  
10 arenas use, we're not talking about huge issues  
11 across all of Manhattan or New York City or  
12 anywhere else, we're talking about highly  
13 localized situations here. Some of the  
14 suggestions that have already been presented more  
15 than handle any additional issues that may crop  
16 up. For example, slicing out particular pieces of  
17 the white space spectrum for exclusive use by  
18 wireless microphone users, which is also actually  
19 something that my colleague Josh here just  
20 commented upon, will mean that everyone will be  
21 able to continue using their existing wireless  
22 microphone devices and everyone else will be able  
23 to use the other spaces that are not specifically  
24 allocated towards that type of usage. In  
25 addition, none of this takes into account any of

1  
2 the vastly superior technologies that are already  
3 available and are going to become more available.  
4 In fact, I give you as an example that same little  
5 Bluetooth device that I pointed out before, this  
6 little ear headset has intelligent technology  
7 called DSSS--Distributes Spread Spectrum  
8 Signaling--that makes sure that I don't ever have  
9 to touch what channel it operates on, it figures  
10 it out automatically by coordinating with my  
11 phone. And what that means is that even though  
12 it's operating on exactly the same frequencies  
13 that my WiFi devices are operating on and any baby  
14 monitors that I might be walking nearby operate  
15 on, and a cordless phone operates on, it still  
16 functions just fine and it doesn't interfere with  
17 other devices, and that's part of the requirements  
18 for being a Part 15 device. And I point this out  
19 because this is old technology, Bluetooth has been  
20 around for a number of years and the standards  
21 have been passed quite a number of years ago, and  
22 what we're really talking about in terms of the  
23 use of white space devices is much newer  
24 technology that does an even better job than the  
25 existing excellent job that existing devices make

1  
2  
3  
4  
5  
6  
7  
8  
9  
10  
11  
12  
13  
14  
15  
16  
17  
18  
19  
20  
21  
22  
23  
24  
25

use of.

[Pause]

CHAIRPERSON BREWER: And what about the television issue, which is also very controversial? Do you feel similar to sort of self--the same description that you just gave for the cultural institutions? Are you also saying that there's loss of compatibility? Go ahead [off mic].

JOSHUA BREITBART: Well, unlike Dana, I'm not an engineer but my understanding of the FCC tests that the devices successfully detected signals far strong--far weaker than what a television needs to display. So I have no concerns about their ability to detect viable television signals.

CHAIRPERSON BREWER: Thank you. I'm sure there's a disagreement with that, but go ahead, Dana, did you want to comment on [crosstalk]--

DANA SPIEGEL: No, I just wanted to comment on what Josh had just mentioned, which is that sensitivity in detecting in the signal-- sorry, in the devices that we're talking about

1  
2 here, unlike the viewpoint raised by the folks  
3 that were on the previous panel, sensitivity is  
4 ultimately a very good thing and it's respectfully  
5 not the--not anyone's job, this council's nor  
6 mine, to indicate to a company what sort of--what  
7 sort of device they're going to be able to market,  
8 but I can tell you, certainly that if you're able  
9 to detect signals, for example TV signals, much  
10 more weakly than is really necessary for the type  
11 of, for the type of use that we're talking about  
12 here, then I am confident that those, those  
13 hardware manufacturers, like Motorola and others,  
14 are going to be able to successfully, not just  
15 build devices that are sensitive enough to not--to  
16 make sure that there's no interference, but are  
17 also useful and utilitarian for all of the uses  
18 that one might expect them to be. So I don't--I  
19 honestly don't buy that comment that was  
20 previously made about, you know, how can you, how  
21 can you manufacture and market a device that's so  
22 sensitive.

23 CHAIRPERSON BREWER: Okay. The  
24 timing is obviously something that we're concerned  
25 about, some others want it to be along the FCC

1  
2 timetable of a November December and then some  
3 folks want to postpone it because they feel  
4 there's not enough information available. I  
5 assume that you feel it should move forward, but  
6 what would happen after that in your opinion? How  
7 far are we from implementation? It took a while  
8 to get, even though we're now in the hotspot and  
9 we have lots of background and we've certainly  
10 done a lot of hotspots in the United States, it  
11 took a little while to get the WiFi rules  
12 promulgated. So what do you think in terms of  
13 current FCC timetable, a little bit more time and  
14 how do you think that would either help or hinder  
15 what you're advocating?

16 TIMOTHY KARR: Well earlier  
17 panelists had indicated correctly, I think that  
18 the process has been long overdue, certainly we're  
19 hopeful that the FCC will issue an order that will  
20 set forth the rules for certification and we want  
21 to make sure that those rules do protect the  
22 various interests that are using spectrum. And as  
23 usual in the process is once those rules are  
24 promulgated, the industry then tries to build  
25 devices that meet that certification standard.

1  
2 The other, the other date here of course is the  
3 February date for the DTV transition so, you know,  
4 I don't see--I don't foresee, you know, come  
5 February 18<sup>th</sup>, you know, a instant flooding of the  
6 market with white spaces devices, I expect it will  
7 take much longer than that as obviously, you know,  
8 the business side takes quite some time, but the  
9 certification process itself will have to be made  
10 very clear. So I think it's time for the FCC  
11 certainly to decide as to the time when these  
12 devices will be made available, there are so many  
13 variables in there, both on the market side and on  
14 the regulatory side. It's too hard to say.

15 CHAIRPERSON BREWER: What do you  
16 think the cost of, I know the gentleman who spoke  
17 earlier who's a producer at Manhattan Neighborhood  
18 Network, he's always trying and we all are to  
19 find, as you are, low cost, affordable access. So  
20 there would be obviously wireless networks, white  
21 space networks, we don't know what the--we got  
22 some descriptions earlier about what the device  
23 might look like or not look like. This is, you  
24 know, we're talking--really nobody but us knows  
25 what in the world we're talking about here, but

1  
2 one question is, what would be the cost associated  
3 with all of this in terms of access? If anybody  
4 knows.

5 JOSHUA BREITBART: Well, that I  
6 think is what is so amazing about this technology  
7 and why we're so hopeful about it. As you know  
8 better than anybody from the, from the Diamond  
9 report, we saw that in terms of broadband  
10 availability, there's very high availability in  
11 the city, 98% have access to cable, 87% have  
12 access to DSL, yet only 56% of moderate and high  
13 income households have adopted it, and only 24% of  
14 low-income households have adopted it. When we're  
15 talking about broadband adoption, what we're  
16 talking about is trying to convince people to  
17 spend more money. That's what the, you know,  
18 that's a lot of--often the problem, that trying to  
19 make that less money or more money, it's still an  
20 additional expense that we're trying to convince  
21 people to spend. What's amazing about wireless  
22 technology is that if you look at cell phone  
23 usage, mobile phone usage, the digital divide,  
24 I've certainly won't say it's erased, but it's,  
25 according to the research from the Pew Internet

1  
2 and American Life Project, it's far more  
3 equivalent than computer usage and at-home  
4 broadband usage. And what we're talking about--  
5 and in fact, you know, I can show you the data,  
6 but that, in fact, in terms of using, you know,  
7 non-voice applications, that, African-Americans  
8 and Latinos actually lead in those areas. You  
9 know, seniors who have, you know, Internet access  
10 below 30% still have like 50% use of mobile  
11 phones. So what we're talking about with wireless  
12 is the ability to deliver those services more  
13 cheaply and deliver Internet connectivity to  
14 people's mobile devices. They would be different  
15 devices, but it's something that people have  
16 already decided they would spend money on that  
17 they recycle--they buy a new device every two or  
18 three years anyway, if you're like me, I hold onto  
19 it for four years. Nevertheless people make--have  
20 decided that it's something they would purchase,  
21 something they would pay for, this would save them  
22 money and deliver broadband access to the device  
23 they're comfortable with right now.

24 DANA SPIEGEL: So I think there's  
25 really two--thank you--I think there's really two,

1  
2 at least two different types of price questions  
3 that you are alluding to Council Member Brewer.  
4 The first is the cost for the actual technical  
5 devices--it's the headsets and the computer  
6 equipment or cards that need to be purchased and  
7 installed and whatnot and I think that we can take  
8 a lot of direction and draw a lot of conclusions  
9 from a number of different technical timelines for  
10 other somewhat similar technology. For example,  
11 WiFi, as I mentioned first, was really initially  
12 invented back in 1991 and has since, when we  
13 started, NYCwireless started, it would cost, you  
14 know, quite a few hundred dollars to buy an access  
15 point and it would cost you a few hundred dollars  
16 to buy a card that would provide slow, slow access  
17 to wireless signals. Since that time, which is  
18 about seven years, what we have seen are orders of  
19 magnitude drops in the cost of the devices  
20 themselves as a direct result of the widespread  
21 usage and widespread adoption of these devices.  
22 So now just about every phone you buy has WiFi and  
23 it has Bluetooth and because of that the  
24 magnitudes of scale drive down prices very  
25 significantly. So what I do expect is that

perhaps initially white space devices might be a little bit more expensive because they are a new technology, very quickly they're going to drop very significantly in costs such that you won't be able to necessarily purchase a laptop or a handheld device without having it built in, just like today, you really can't purchase a laptop or a handheld device without WiFi or Bluetooth being built in. The second question that you had--I'm sorry, the second part of the question is about service and what, what it's going to cost for us to make use of this new spectrum and for that I can also point to the history of NYCwireless and its use of WiFi technology. It used to be the case that, and a good example of this is Bryant Park, where we needed thousands upon thousands of dollars of Cisco equipment in order to light up the park and it worked incredibly well and we've learned a lot since then. And one of the things that we've learned is how to make use of the much-much less lower cost devices that can offer the same quality of service--in fact greater quality of service. We just installed a hotspot in Clinton at a nonprofit there providing WiFi access

1  
2 to a local playground in a--right next to a low-  
3 income housing development. The cost of the  
4 hardware in its entirety was a few hundred dollars  
5 and this is, again, drops by orders of magnitude  
6 in terms of the cost of installing these devices.  
7 The biggest cost for getting FiOS, for example,  
8 that Verizon is incurring right now, are the  
9 actual street rolls [phonetic]. It's actually  
10 getting--hiring someone or contracting out with  
11 someone to go out and install the actual fiber and  
12 draw it along the streets and run it into the  
13 buildings and so on and so forth. And so what  
14 we've seen with some of the low-income housing  
15 units that we've installed free WiFi into is that  
16 we can do this--we can provide a similar level of  
17 service in terms of Internet access for maybe a  
18 thousand or a couple thousand of dollars for the  
19 entire building in terms of equipment and  
20 installation cost versus the probably tens, if not  
21 hundreds of thousands of dollars, that it might  
22 cost Time Warner cable to do the cable runs and  
23 draw out--or Verizon to draw out phone lines to  
24 those same locations. And so what we fully expect  
25 is that with white space devices, once the

1  
2 hardware comes down to a point where it becomes  
3 accessible for most people and widely distributed,  
4 that we'll be able to roll out Internet service  
5 very inexpensively, far more inexpensively than  
6 most of the other Internet service providers do  
7 today.

8 CHAIRPERSON BREWER: All right.  
9 Thank you very much. [Off mic] I want to thank  
10 this panel for extraordinarily--working  
11 extraordinarily hard to produce testimony and for  
12 your support and we will continue to work  
13 together. Thank you very much.

14 MALE VOICE: There's three left, I  
15 don't--

16 [Pause]

17 CHAIRPERSON BREWER: Gracey  
18 Stodder, who's a representative of Congresswoman  
19 Carolyn Maloney.

20 FEMALE VOICE: These two are  
21 against.

22 CHAIRPERSON BREWER: [Off mic]  
23 Stephanie Lim [phonetic] and also John Weaver.  
24 [Pause] Ms. Stodder, I hope you're here still.  
25 Good, why don't you come on up. [Pause] This is

1  
2 the last panel. [Pause] Go right ahead, thank  
3 you for being here. [Pause] You got to push the  
4 button, it's the old technology.

5 GRACEY STODDER: Okay. Thank you,  
6 Madame Chairman and members of the City Council  
7 for your attention. Congresswoman Carolyn B.  
8 Maloney regrets that she cannot be here and has  
9 asked me, Gracey Stodder, to testify on her  
10 behalf. In the interest of time, I will summarize  
11 her two-page testimony, of which I have given  
12 copies to the Master of Arms. Today, I want to  
13 offer testimony to express my strong reservations  
14 regarding the possibility that the Federal  
15 Communications Commission will permit unlicensed  
16 operation in the TV broadcast bands commonly  
17 referred to as white spaces based on the very  
18 circumspect results derived from the Commission's  
19 laboratory and field testing earlier this year.  
20 The FCC's tests, one of which was conducted right  
21 here in the Broadway district at the Majestic  
22 Theatre, demonstrated that these devices are very  
23 likely to cause debilitating interference to  
24 wireless microphones, especially in urban  
25 environments like New York City. The impact could

1  
2 have serious repercussions on live theater in New  
3 York, which contributes \$5 billion to the city's  
4 economy and 44,000 full-time jobs to city  
5 residents. To give you an idea of just how  
6 congested Manhattan's white space is, 40 Broadway  
7 theaters put on daily performances using up to 200  
8 different frequencies for their microphones in  
9 each venue, and television studios such as MTV,  
10 ABC, and others share crowded airwaves using a  
11 good neighbor policy. Technology that is not  
12 ready for prime time could also interfere with  
13 pre-existing devices used by smaller, but  
14 important organizations, such as churches and  
15 community centers. Diverse groups such as the  
16 National Association of Broadcasters, the National  
17 Religious Broadcasters, churches across the  
18 nation, the NFL, NASCAR, Grand Ole Opry, the  
19 Country Music Association, Broadway, Cirque du  
20 Soleil, and the MGM Grand have expressed serious  
21 concern. Last week, proponents of these new  
22 devices held a pep rally on Capitol Hill intended,  
23 in their words, to encourage the FCC to approve  
24 white space devices this year before the  
25 presidential election. I don't believe that this

1  
2 issue is so time sensitive that we should look the  
3 other way so the Bush administration can make  
4 another long-term policy decision that cannot be  
5 undone and which potentially devastates Broadway  
6 productions. It makes much more sense in my  
7 opinion, to let the next administration settle in,  
8 appoint its own FCC commissioners, and revisit the  
9 issue at that time. In conclusion, I want to  
10 emphasize that I support innovation and encourage  
11 the efficient use of public airwaves, but not at  
12 the expense of existing wireless microphone  
13 systems that provide an important public good. We  
14 can not afford the risk that premature devices  
15 will play havoc with essential equipment used by a  
16 multibillion-dollar New York City industry. I  
17 encourage the City Council to make a strong  
18 statement in support of Broadway and wireless  
19 microphone use throughout the city. Thank you.

20 CHAIRPERSON BREWER: Thank you very  
21 much sir?

22 JOHN WEAVER: Good afternoon.  
23 Thank you very much, Council Member Brewer, for  
24 having this committee meeting and my name is John  
25 Weaver, I'm with Liberty Imaging here in New York

1  
2 City. I'm mostly a technologist, I've been with  
3 the broadcasting industry for about 40 years.  
4 Currently I am working on developing very high-  
5 resolution cameras for the security industry, I'm  
6 a member of the Security Industry Association and  
7 a member of the Society of Motion Picture and  
8 Television Engineers. I have several remarks in  
9 my paper on the question of the wireless  
10 microphones, but I just make two quick remarks  
11 before my statement. First of all, the FCC has  
12 established docket number 08166 to address the  
13 issue of wireless. This docket means that they  
14 have started the certification process. They will  
15 set a series of meetings within the organization  
16 to establish standards and rules for  
17 certification. I'm quite certain, I have a long  
18 history with the FCC and working with them and  
19 mostly on digital and HDTV standards issues, and  
20 I'm quite certain they're very sensitive to this  
21 issue and their history is that they certainly  
22 don't want to put anybody out of business and  
23 they'll find a way of accommodating this. The  
24 second thing I would add to that is the IEEE,  
25 which is the standards-making body, which was

1  
2 mentioned earlier by one of the previous people  
3 testimony--testifying sitting in the seat which  
4 had developed 802.11, which is a very successful  
5 standard for WiFi. Has also established 802.22,  
6 which is a committee working on this issue and  
7 they will develop standards for microphone--  
8 wireless microphones. Right now, they've already  
9 established preliminary standard for fixed  
10 microphones and another group is working on the  
11 wireless, so I feel very confident from a  
12 technical point of view that the RF engineers will  
13 resolve this. I might add that of all the areas  
14 in television and audio broadcast, RF is the most,  
15 if I may say, treacherous for engineers, it's a  
16 very difficult area, highly specialized. However,  
17 RF engineers have been dealing with this problem  
18 for over 75 years and are well grounded and well  
19 familiar with the issue. So I'm quite certain  
20 that they will find a solution and it may not be--  
21 the bad news is that everybody involved in the  
22 transition from analog to digital will have to  
23 make a new investment, there's no way around this.  
24 The broadcast industry in New York City is the  
25 highest concentration anywhere in the world, they

1  
2 just transitioned from analog to digital  
3 television, it's cost billions of dollars--none of  
4 them wanted to do it, but they did it anyhow and  
5 it's going to be very successful. So I'm sure  
6 that this will be successful too. The question  
7 here on, as far as my testimony is concerned, has  
8 to do with the economic opportunity that white  
9 space, white space has offered to New York City.  
10 And while it's absolutely true that white space in  
11 our spectrum here represents only about 20% of the  
12 available space as opposed to much higher  
13 allocations in rural areas, that white space also  
14 is the maybe last bastion of hope for a very low  
15 cost, high-bandwidth service throughout the city.  
16 And the issues in my, in my view are education to  
17 start with, we need to get much higher bandwidth  
18 in the schools. This is an absolute, this is not  
19 a question of [crosstalk]--

20 CHAIRPERSON BREWER: We're aware of  
21 that, we're aware of that.

22 JOHN WEAVER: I'm sure, but I'm  
23 testifying. This is an absolute. We've gone from  
24 3<sup>rd</sup> to 16th in worldwide adaptation of broadband.  
25 You can--in Japan, you can pick up the phone and

1  
2 get gigabit service. Our children are at a huge  
3 disadvantage, which won't appear in their careers  
4 for the next 20 years, but eventually it will.  
5 And New York has the most diverse population in  
6 the world which produces synergistic effect of  
7 having the most creative the population in the  
8 world and we have here the opportunity to generate  
9 a new business, a new industry. It may not be as  
10 big as broadcasting, but it's one that New York  
11 City could very easily dominate if it's handled  
12 properly. And I think there is--that  
13 opportunity's before us. We've missed out on a  
14 few other opportunities in the past, particularly  
15 HDTV because of a lack of understanding of the  
16 opportunity and a lack of investment. But in  
17 addition to that, the propagation characteristics  
18 of this spectrum is very good for video, much  
19 higher than Internet service today. So creating  
20 video services, whether they're for entertainment  
21 or law enforcement or emergency uses, would  
22 provide much better quality video than in the  
23 past. And I look at the situation for security,  
24 which is my particular focus in providing higher  
25 security systems for public buildings,

1  
2 particularly public housing, which is depleted now  
3 because of the services there, the technical  
4 infrastructure there is not capable, would you  
5 like to ask questions?

6 CHAIRPERSON BREWER: We just need  
7 to wrap up 'cause we got, it turns out there are  
8 two more people who signed up--

9 JOHN WEAVER: Okay.

10 CHAIRPERSON BREWER: --so if you  
11 could just wrap up and we can include your--

12 JOHN WEAVER: All right. Sure.

13 CHAIRPERSON BREWER: --testimony as  
14 part of the record.

15 JOHN WEAVER: Okay. Yes, I did.  
16 The last thing I would suggest is just, as an  
17 initiative, we should be possibly looking at,  
18 instead we're getting too sidetracked on this,  
19 what is a solvable technical issue with  
20 microphones, possibly look at a broader view of  
21 developing some enterprise to create an industry  
22 in New York by both supplying high-bandwidth  
23 service to the community, particularly schools and  
24 libraries, but also the educational background  
25 support for our children to learn how to develop

1  
2 businesses around this technology. This, I think,  
3 would be the most important thing we could do  
4 rather than being too terribly concerned about a  
5 technical issue we actually can't do much about.

6 CHAIRPERSON BREWER: Thank you very  
7 much, thank you both for your testimony. The  
8 final two speakers are Michael Lewis, Wireless  
9 Harlem, and Dharma Dailey of the Ethos Group and  
10 that's it. I'm sorry I didn't know that you  
11 wanted to speak.

12 [Pause]

13 [Off mic]

14 CHAIRPERSON BREWER: Whomever,  
15 whomever would like to start, go ahead.

16 MICHAEL LEWIS: Good morning. My  
17 name is Michael Lewis, I'm the founder of a  
18 nonprofit organization called Wireless Harlem.  
19 Thank you for the opportunity to testify at  
20 today's hearing. I'm here today to urge the City  
21 Council not to delay the FCC's introduction of new  
22 unlicensed wireless spectrum or TV white spaces.  
23 I wanted to just start by talking about Intel  
24 Corporation, Intel Corp. Chairman Andy Grove laid  
25 out a new principle when he discussed a concept he

1  
2 called strategic inflection points. He observes  
3 this concept during his stewardship of Intel, and  
4 he said that these strategic inflection points  
5 represent moments in history when new developments  
6 in the marketplace represent an opportunity for  
7 fundamental change. One could argue that we are  
8 at such a crossroads today with TV white spaces or  
9 more importantly more and better wireless  
10 spectrum. The public benefit is very clear: for  
11 rural communities, WiFi signals could cover  
12 greater distances and reach more households and in  
13 larger cities like New York, WiFi signals over  
14 white spaces could cover more people in densely  
15 populated area and using far fewer wireless radios  
16 than necessary today. At the beginning of this  
17 year we started a program in partnership with the  
18 Children Storefront in East Harlem called Tech  
19 Saturdays where once a month we give refurbished  
20 computers to any family in Harlem that wants one.  
21 Since the beginning of this year, our volunteer  
22 group has given away nearly 500 computers to  
23 families. While today we have the computers, in  
24 fact we are running out of space to store the PCs  
25 and eMacs we get from other schools, we also use

1  
2 license-free software to install word processing  
3 and educational programs, but the missing element  
4 for most families is still the broadband  
5 connection. This is primarily because the costs  
6 for families is out of reach. But our  
7 organization isn't only hearing from these  
8 families, we get calls from students, college  
9 students, small business owners, and more and more  
10 residents of Harlem e-mail us and say they cannot  
11 get affordable--cannot--who can afford broadband  
12 access but for whatever reasons have been stalled  
13 in their efforts to get connected using today's  
14 carriers. With the introduction of more and  
15 better widely available spectrum, more  
16 neighborhoods and small business owners would be  
17 able to get access especially in spaces where  
18 there is difficulty in reaching customers or when  
19 affordability is an issue or for small business  
20 owners who have to spend resources in other areas.  
21 This development shouldn't be seen as occurring at  
22 the expense of current telcos [phonetic] and cable  
23 providers. Indeed, for many residents who cannot  
24 afford broadband connectivity, WiFi over white  
25 spaces could be a viable first option from

1  
2 community-based organizations like ours and many  
3 others across New York. As more residents became  
4 familiar with download and upload speeds and as  
5 their needs change, they would have the option of  
6 moving up in price and speed. Over the past  
7 several months, we have tested commercial and off-  
8 the-shelf mesh networking equipment. We believe  
9 that it represents--mesh networking represents the  
10 realization of low cost, easy to deploy broadband  
11 networks. During our tests, including several  
12 within 100 to 200 feet of large and small churches  
13 using wireless microphones, no interference issues  
14 were reported. The spectrum being freed up with  
15 TV white spaces would be key for the spread of  
16 broadband access to more of New York's  
17 neighborhoods and small businesses. I'll end by  
18 saying that today there is a great deal of  
19 positive public awareness being generated on radio  
20 and television commercials alerting residents that  
21 with the onset of DTV in February 2009, that many  
22 older televisions will not work. Our hope is that  
23 shortly after this shift takes place, we will be  
24 able to explain to consumers and small businesses  
25 that the abandoned white spaces also open the door

1  
2 for more wireless broadband options for New York's  
3 neighborhoods and small businesses. Thank you for

4 --

5 CHAIRPERSON BREWER: [Interposing]  
6 Thank you, and Kathy at Children's Storefront  
7 loves you, she's the principal.

8 MICHAEL LEWIS: Thank you very  
9 much.

10 CHAIRPERSON BREWER: Go ahead.

11 [Off mic]

12 [Pause]

13 CHAIRPERSON BREWER: You have to  
14 push the button, it's low technology. [Off mic]

15 DHARMA DAILEY: Okay. My name is  
16 Dharma Dailey, I am the Director of Research for  
17 the Ethos Group, a consulting company, which  
18 focuses on the social impact of local broadband.  
19 In plain language, I do participatory acts in  
20 research, which means I get to go around the  
21 country and sleep on people's couches and see what  
22 kind of connectivity that they have and try to  
23 work with, directly with community advocates,  
24 community media groups, media reform groups at the  
25 grassroots level to address the persistent

1  
2 communication gaps that exist in local  
3 communities. I don't define this work as digital  
4 divide work because it's not about technology,  
5 it's about solving people's communication  
6 problems. I'm going to skip through most of my  
7 testimony 'cause I'm sure people want lunch. But  
8 briefly, there is an arc over the last hundred  
9 years that's continuous and steady progress of  
10 technologies that allow for more intensive use of  
11 the airwaves. One example that I think is really  
12 exciting I just learned about last week, which is  
13 not necessarily a wireless white space device, but  
14 an FCC engineer that I was speaking with last  
15 week, on his desk is looking at retinal implants.  
16 Retinal implants are electronic devices that are  
17 so precise, they work exactly with the brain waves  
18 in your own brain at just the right power and just  
19 very frequency to be able to give sight to the  
20 blind. And this is the kind of precision that is  
21 here and available to us and we should be using  
22 that kind of precision to get more public, more  
23 public areas available to more of the public.  
24 I've been an advocate for opening up the airwaves  
25 to the public for over 15 years, which means that

1  
2 I spent about a third of my time on the road with  
3 grassroots groups and about a third of my time  
4 sitting through proceedings like this and a lot of  
5 the things that I heard today are not new. Maybe  
6 it's not Motorola or Shure, maybe it's the  
7 National Association of Broadcasters or some other  
8 group, but the tactic of couching business models  
9 and political agendas around technology is a  
10 persistent tactic that consistently we come across  
11 as we fight to open up the airwaves for public  
12 use. The National Association of Broadcasters  
13 would look like right fools if they had gone to  
14 the FCC and to Congress and said that tiny three  
15 watt stations that broadcast to a city block or a  
16 suburban neighborhood or a housing project like  
17 the one that I grew up in, would fracture their  
18 market share so we need to keep them off the air.  
19 Instead, they say tiny neighborhood radio stations  
20 will make airplanes fall out of the sky. I  
21 appreciate what the broadcast engineers today have  
22 said about the different--difference of RF or  
23 interference and the challenges that provides. My  
24 strongest recommendation to the Council would be  
25 to go directly to the FCC engineers because they

1  
2 are the closest thing that we have in the public  
3 sphere to--they're engineers who work on the  
4 public's behalf and I would suggest to you that,  
5 instead of bringing in manufactures and so forth  
6 to discuss the different merits of their different  
7 technologies, pick up the phone and get some of  
8 those guys here or go down to the FCC and talk to  
9 them. There's a number of briefings that have  
10 come out in these proceedings that are meant for  
11 policymakers and meant for non-engineers that go  
12 over all of the different technologies that are  
13 being discussed. The one that I found the most  
14 helpful and useful for a non-engineer is that  
15 cognitive radio and PRM, notice of proposed  
16 rulemaking, which is what Commissioner Powell had  
17 got started, that gives an overview of all these  
18 technologies. And the important thing to  
19 understand is that most of these technologies are  
20 not new technologies, but what's innovated is not  
21 the technology itself, but the way that the  
22 technology is being applied. And what we as  
23 community advocates are asking for is we're saying  
24 let's take--let's look at the deck of all of the  
25 different cool technologies that have been around,

1  
2 you know, old and new and let's shake those up to  
3 see how we can get more intensive use of the  
4 public airwaves for our public uses like  
5 broadband. [Pause] I disagree with a lot of the  
6 testimony that I heard earlier about how easy it  
7 is for mom-and-pop groups whether they're civic,  
8 cultural, economic, or small government to be able  
9 to negotiate the licensing system at the FCC as  
10 somebody that has held hands with a number of  
11 community groups going through that process and  
12 found it to be extremely difficult. And so as we  
13 look forward at the different opportunities that  
14 these new technologies, we're looking at what we'd  
15 like to do is we'd like to push the FCC and push  
16 the licensing regime down into the streets where  
17 we're lowering the barriers to entry, making the  
18 technologies do more of the work of figuring out  
19 how to share the, share the airwaves nicely and I  
20 think that that's really possible. [Pause] I'm  
21 also not a resident of New York City and, while I  
22 respect the fact that the Broadway industry is a  
23 very important industry for this country, this is  
24 unique environment. The resolution as it reads  
25 now will be read in a very politicized way as

1  
2 something that is favoring the industries that  
3 exists perhaps some of the most well-endowed  
4 cultural institutions and most well-known cultural  
5 institutions in the world over, over things like  
6 rural broadband, which is what we're fighting for.

7 [Pause] In most places in the U.S. there's a,  
8 what's called the point of presence and that is a  
9 place where you have really good broadband  
10 connectivity coming into the community that is  
11 somewhere within a few miles of most of us. And  
12 in most places in the U.S. there is competition up  
13 to that point of presence with dozens or sometimes  
14 even over a hundred different providers that are  
15 bringing connectivity into the community. But  
16 spiraling out from that point of presence in a lot  
17 of places, including some areas of where I live in  
18 Greene County, there is no broadband even by the  
19 lousy definition of broadband that we have in this  
20 country. Cable and DSL are stopgap technologies  
21 that won't be considered broadband in a few years  
22 and even so--but they haven't gotten to every  
23 place in the country. [Pause] So only 38% of  
24 rural Americans have broadband service right now  
25 and part of that is not just that they can't

1  
2 afford it, which is an issue, but also it's not  
3 available. [Pause] Our area of Greene County  
4 typifies a lot of the problems that are in rural  
5 areas. Recently I spoke with a broadband adviser  
6 to former Governor Spitzer who tell me that he had  
7 familiarity with my county. He used a single word  
8 to describe our communications infrastructure--  
9 hopeless. In context, I believe he was not only  
10 discussing the infrastructure, but also the lack  
11 of vision in the county. In preparing for the  
12 hearing, I spoke with a county economic adviser  
13 who told me it was invasive and inappropriate for  
14 the county to keep track of where communication  
15 services are available for county residents, which  
16 may explain why my neighbors--some of my neighbors  
17 like 28% of rural Americans according to Pew--  
18 which I brought a copy of the most recent Pew  
19 Internet research for you--can't get broadband at  
20 any price. And like most of my county, I have  
21 something that I'm paying for that's called  
22 broadband, but the service is not what--the  
23 quality that I expect. The cables are strung from  
24 telephone poles, we have regular weather-related  
25 outages that can last for hours, and while my

1  
2 neighbors are inconvenienced by not being able to  
3 get television service, for me, my livelihood  
4 depends on broadband, so it's a productivity issue  
5 for me.

6 CHAIRPERSON BREWER: Can you wrap  
7 up? I'm sorry. Thank you.

8 DHARMA DAILEY: This is the end. I  
9 just want to urge the Council to consider changing  
10 the language that you have in your current  
11 proposal to reflect the shifting expectations that  
12 the public now has to be able to use the airwaves  
13 in more intensive ways and to focus on the public  
14 demand of pushing for a regime that makes it  
15 easier for artists and everyone else to  
16 accommodate public use.

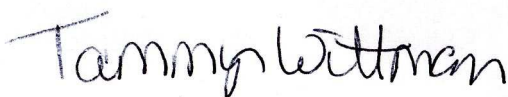

17 CHAIRPERSON BREWER: Thank you both  
18 very much. I want to say three things. First of  
19 all, the administration wasn't here, but the  
20 Department of Information Technology and  
21 Telecommunication did submit testimony and we will  
22 put it on the record, they do support the  
23 resolution. Second, we're going to try for the  
24 first time to get everybody's testimony up on the  
25 City Council website and we also have a blog, so

1  
2 it will be up on there, and of course, it's all  
3 live I think in terms of different types of  
4 technology being used here today. And just  
5 finally, we will take everybody's words into  
6 consideration, you can see, for those of you who  
7 didn't know that this is a very important topic.  
8 The only caveat I will say, and I've said it many  
9 times today, is we all live in different parts of  
10 the country, but those of us who live in New York  
11 City feel very strongly about our industry and  
12 feel very strongly about our cultural institutions  
13 and so we want to accommodate them, as somebody  
14 with a long history of figuring out how we can  
15 have more access in the city of New York, the  
16 words of people who advocated for that, we take  
17 very seriously and I think, you know, not to be  
18 too--not to leave anybody out, we want to make  
19 sure that there's no interference for television  
20 or anything else. So we have a broad agenda, but  
21 I appreciate the time and effort that people made  
22 to come here today and we will keep in touch. We  
23 will put everything up on the web and we will  
24 share with you when there's a vote and what we're  
25 doing. Thank you very much.

C E R T I F I C A T E

I, Tammy Wittman, certify that the foregoing transcript is a true and accurate record of the proceedings. I further certify that I am not related to any of the parties to this action by blood or marriage, and that I am in no way interested in the outcome of this matter.
